COST FOR A CONTROLLED LINEAR KDV EQUATION

JOACHIM KRIEGER AND SHENQUAN XIANG*

Abstract. The controllability of the linearized KdV equation with right Neumann control is studied in the pioneering work of Rosier [L. Rosier, ESAIM: COCV 2 (1997) 33-55]. However, the proof is by contradiction arguments and the value of the observability constant remains unknown, though rich mathematical theories are built on this totally unknown constant. We introduce a constructive method that gives the quantitative value of this constant.

1. Introduction

The goal of this paper is to give a quantitative cost estimate of the controlled system

\[ u_t + u_x + u_{xxx} = 0, \quad u(t, 0) = u(t, L) = u_x(t, L) = 0, \quad u_x(t, L) = a(t). \]

Theorem 1.1. Let \( L > 0 \). There exist effectively computable \( T_0 = T_0(L) > 0 \) and \( c = c(L) > 0 \) such that for any \( T \geq T_0 \) the solution \( u \) of

\[ u_t = -u_x - u_{xxx}, \quad u(t, 0) = u(t, L) = u_x(t, L) = 0, \quad u(0, x) = u_0(x), \]

satisfies

\[ \int_0^T |u_x(t, 0)|^2 \, dt \geq c \| u_0 \|^2_{L^2(0, L)}, \forall u_0 \in L^2, \text{ if } L \not\in \mathcal{N}; \]

\[ \int_0^T |u_x(t, 0)|^2 \, dt \geq c \| u_0 \|^2_{L^2(0, L)}, \forall u_0 \in H \subset L^2, \text{ if } L \in \mathcal{N}. \] (1.1) (1.2)

Here \( H \) is the controllable subspace, and \( \mathcal{N} \) is the so called critical length set that is given by

\[ \mathcal{N} = \left\{ 2\pi \sqrt{\frac{k^2 + kl + l^2}{3}} ; k, l \in \mathbb{N}^* \right\}. \]

Keywords and phrases: Korteweg-de Vries, controllability, cost, observability.

Proposition 1.2. Let $u \in L^2(0,T)$ such that for any $\gamma > 0$ there is $\varepsilon = \varepsilon(L,\gamma) > 0$ effectively computable with the property that, if there are $u \in L^2(0,L) \setminus \{0\}, K_1 \geq K_1(L)$, and $T \geq T_0(L)$ satisfying
\begin{equation}
\int_0^T \left| (S(t)u)_{x}(t,0) \right|^2 \, dt < \varepsilon \|u\|_{L^2(0,L)}^2,
\end{equation}
then $B_\gamma(K_1)$ is not empty.

In conjunction with the preceding propositions, this then implies that we can set $c = \varepsilon(L,\gamma(L,\bar{K}_1(L)))$ in (1.1) for Theorem 1.1.
Remark 1.4. We only prove Propositions 1.2 and 1.3 for $L \geq 4$, though the same way of the proof also applies to the other cases. In fact, when $L$ is below $\sqrt{3} \pi$ (which is small than the first critical length $2 \pi$), an alternative simple proof in [6] gives an explicit observability constant, which, for the completeness of the paper, is also presented, see Appendix A.

2. Some properties of $S(t)$

From now on we always assume that $L \geq 4$. The goal of this section is to develop several properties concerning the smoothing effect of $S(t)$. All the results stated here will be demonstrated, and all the constants will be explicitly characterized, in Appendix B.

Due to some compatibility issues, we define the following Sobolev spaces $H^k_{(0)}$ satisfying natural compatibility conditions on the boundary,

\[
H^0_{(0)}(0, L) := L^2(0, L);
\]

\[
H^1_{(0)}(0, L) := \{ f \in H^1, f(0) = f(L) = 0 \};
\]

\[
H^2_{(0)}(0, L) := \{ f \in H^2, f(0) = f(L) = f'(L) = 0 \};
\]

\[
H^3_{(0)}(0, L) := \{ f \in H^3, f(0) = f(L) = f'(L) = f''(L) = 0 \};
\]

\[
H^4_{(0)}(0, L) := \{ f \in H^4 \cap H^3_{(0)}, (Af)(0) = (Af)(L) = 0 \};
\]

\[
H^5_{(0)}(0, L) := \{ f \in H^5 \cap H^3_{(0)}, (Af)(0) = (Af)(L) = (Af)_x(L) = 0 \};
\]

\[
H^6_{(0)}(0, L) := \{ f \in H^6 \cap H^3_{(0)}, (Af)(0) = (Af)(L) = (Af)_x(L) = 0 \},
\]

with the same norm as $H^k$:

\[
\|f\|^2_{H^k(0, L)} := \int_0^L |f^{(k)}(x)|^2 + |f(x)|^2 \, dx.
\]

Lemma 2.1. There is a constant $E_m^n$ which only depends on $n < m$ such that

\[
\int_0^L |f^{(n)}(x)|^2 \, dx \leq E_m^n \left( \delta^{m-n} \int_0^L |f^{(m)}(t)|^2 \, dt + \delta^{-n} \int_0^L |f(t)|^2 \, dt \right), \quad \forall \delta \in (0, 1].
\]

Now we are ready to prove the following properties concerning regularities of the flow $S(t)$. Suppose that $f_0 \in L^2$, $f(t, x) = S(t)f_0$, then simple integration by parts yields

\[
\int_0^T \int_0^L f_2^2(t, x) \, dx \, dt \leq \frac{T + L}{3} \int_0^L f_0^2(x) \, dx,
\]

\[
\int_0^L f^2(t, x) \, dx = \int_0^L f_0^2(x) \, dx - \int_0^t f_2^2(s, 0) \, ds \leq \int_0^L f_0^2(x) \, dx.
\]

The preceding two inequalities tell us that starting from some $L^2$ data the solution will stay in the same space, moreover, on almost every (time) $t \in [0, T]$ the solution becomes $H^2(0, L)$ thus gains regularity. Actually, similar regularity results hold for arbitrary order:

Lemma 2.2. Let $k \in \{0, 1, 2, 3, 4, 5, 6\}$. If the initial data $f_0$ belongs to $H^k_{(0)}$, then the flow $S(t)f_0$ stays in $C([0, T]; H^k_{(0)}(0, L)) \cap L^2(0, T; H^{k+1}_{(0)}(0, L))$. Moreover, there exist constants $F_0^k(L)$ and $F_1^k(L)$ independent of
the choice of \( f \in H^k_{(0)} \) and \( T \in (0, L] \) such that
\[
\|S(t)f_0\|_{C([0,T];H^k_{(0)}(0,L))} \leq F^k_0 \|f\|_{H^k_{(0)}(0,L)},
\]
(2.3)
\[
\|S(t)f_0\|_{L^2(0,T;H^{k+1}_{(0)}(0,L))} \leq F^k \|f\|_{H^k_{(0)}(0,L)}.
\]
(2.4)

Remark 2.3. The same type of smoothing results also hold for the nonlinear KdV flow (e.g. \([3]\)). But this phenomenon only appears for initial boundary value problems, it does not exist for KdV flow on whole space.

An immediate consequence is the following smoothing effect result.

Lemma 2.4. Let \( k \in \{1, 2, 3, 4, 5, 6\} \). There exists a constant \( F^k_s = F^k_s(L) \) only depending on \( L \) such that
\[
\|S(t)f_0\|_{H^k_{(0)}(0,L)} \leq F^k_s t^{k/2} \|f_0\|_{L^2(0,L)}, \forall t \in (0,T], T \leq L,
\]
(2.5)
\[
\|S(t)f_0\|_{H^k_{(0)}(0,L)} \leq F^k_s L^{k/2} \|f_0\|_{L^2(0,L)}, \forall t \in [L, +\infty).
\]
(2.6)

Remark 2.5. The rate \( t^{-k/2} \) in Lemma 2.4 is optimal by assuming Lemma 2.2. Moreover, both of them can be generalized to \( k \in \mathbb{N} \), while more (but similar) efforts are required to get explicit values.

For any given \( K > 0 \), let \( A = A_K \) be
\[
A := \{u \in H^3(0, L), u(0) = u(L) = 0, \|u\|_{H^3(0,L)} \leq K\}.
\]

Then we have the following simple

Lemma 2.6. There exist \( B = B(L, K) \) and a set
\[
\{f_1, f_2, \ldots, f_B\} \subset H^3(0, L),
\]
such that for each \( f \in A \), there is \( f_j \) with
\[
\|f - f_j\|_{L^2(0,L)} < \frac{\sqrt{2}}{2}.
\]

An immediate consequence is the

Corollary 2.7. Assume that \( \{g_1, g_2, \ldots, g_P\} \subset A \) is orthonormal. Then \( P \leq B(L, K) \).

3. Proofs of Proposition 1.2 and Proposition 1.3

This section is devoted to the proof of the two main propositions of this paper. In the following we will work with a parameter \( K \) much bigger than 8, which will eventually determine \( K_1 = K_1(L, K) = B^2(L, K)K \). For ease of notations, from now on, let

\[
\|\cdot\| \text{ refers to the } L^2\text{-norm, and } \langle \cdot \rangle \text{ refers to the } L^2\text{-inner product;}
\]
\[
\Pi_{\{y_1, \ldots, y_n\}}^+ \text{ refers to } \Pi_{\{\text{span}\{y_1, \ldots, y_n\}\}^\perp};
\]
\[
f = \mathcal{O}(a) \text{ if } |f| \leq |a|, \quad g = \mathcal{O}_H(a) \text{ if } \|g\|_H \leq |a|, \text{ etc.}
\]

First, we prove Proposition 1.2, following the procedure in Rosier’s proof. Observe that this proposition is ineffectively true, since if it’s false, we can find a sequence \( \gamma_n \to 0 \) as well as functions \( u_n \) with associated \( \lambda_n \).
as in the definition of $B_{\gamma}$ with $\|u_n\|_{H^3} \leq K_1$, and so in particular a subsequence will have $\lambda_n \to \lambda_*$ as well as $u_n, u_{n,x}$ converge point wise, and also in $H^3$ weak sense, to some $u_*$ which is as in Rosier's result, and hence results in a contradiction. Rendering this effective will require 'perturbing Rosier's proof'.

**Proof of Proposition 1.2.** Assume that $L \notin N$ and let $u \in B_{\gamma}$, as in the statement of that proposition, thus there exist $\lambda$ and $f(x)$ such that

$$\lambda u(x) + u'(x) + u'''(x) = f(x), x \in (0, L),$$

(3.1)

$$\|u\|_{L^2} = 1, \|u\|_{H^3} \leq K_1, u(0) = u(L) = u_x(L) = 0, |u'(0)| < \gamma, \|f\|_{L^2} < \gamma.$$  

(3.2)

At first we can get some information about $\lambda$ from the above equation on $u$. In fact, we get from the preceding equation that

$$|\lambda| \|u\|_{L^2} - \left( 1 + \sqrt{E_3} \right) \|u\|_{H^3} \leq |\lambda| \|u\|_{L^2} - \|Au\|_{L^2} \leq \|\lambda u + u' + u'''\|_{L^2} < \gamma,$$

thus $\lambda$ is bounded by

$$|\lambda| < \gamma + \left( 1 + \sqrt{E_3} \right) K_1 < 1 + \left( 1 + \sqrt{E_3} \right) K_1 =: K_2.$$

Moreover, direct integration by parts from equation (3.1) yields

$$\lambda \langle u, u \rangle = \langle -u' - u''', f, u \rangle,$$

which, combined with (3.2), leads to

$$\text{Re}(\langle u', u \rangle) = 0, \ \text{Re}(\langle u''', u \rangle) = \frac{1}{2} |u'|^2(0).$$

Therefore, $\lambda$ is close to the imaginary axis,

$$|\text{Re}(\lambda)| \leq 2\gamma.$$

Then we derive further information on $u$ from classical complex analysis. By extending $u$ and $f$ trivially past the endpoints of the interval $[0, L]$, we obtain a function $u \in H^{\frac{3}{2} -}(\mathbb{R})$, which satisfies the relation

$$\lambda u + u' + u''' = f + u''(0)\delta_0 + u'(0)\delta'_0 - u''(L)\delta_L, x \in \mathbb{R}.$$

Then, the extended function $u$, via the Fourier(-Laplace) transformation, further satisfies

$$\hat{u}(\xi) \cdot \left( \lambda + (i\xi) + (i\xi)^3 \right) = \alpha - \beta e^{-iL\xi} + \delta i\xi + \hat{f}(\xi),$$

where $\alpha := u''(0), \beta := u''(L), \delta := u'(0)$. It is followed from Paley-Wiener theorem that $\hat{u}(\xi)$ and $\hat{f}(\xi)$ are holomorphic functions when extended on complex valued $\xi$, as $u(x)$ and $f(x)$ are compactly supported.
We conclude that away from the zeroes of the polynomial \( \lambda + (i\xi) + (i\xi)^3 \), we have the representation
\[
\hat{u}(\xi) = i\frac{\alpha - \beta e^{-iL\xi} + \delta i\xi + \hat{f}(\xi)}{p - \xi + \xi^3}, \quad p = i\lambda.
\]

Then observe that \((\alpha, \beta) \neq (0, 0)\) since otherwise we cannot possibly have the normalisation condition \( \|u\|_{L^2} = 1 \) (or \( \|\hat{u}\|_{L^2} = 2\pi \)), provided \( \gamma \) is small enough. In fact, if the function
\[
i\delta i\xi + \hat{f}(\xi)\frac{p - \xi + \xi^3}{p - \xi + \xi^3} \in L^2(\mathbb{R}),
\]
then the polynomial \( p - \xi + \xi^3 \) has to divide the numerator, in the sense that the quotient is an entire function as well. But since \( |p| = |\lambda| < K_2 \), the roots of this polynomial lie in a disc of radius \( R = R(K_1) \) centered at the origin:
\[
|\xi|^3 = |\xi - p| < K_2 + |\xi| < K_2 + \frac{1}{3}|\xi|^3 + \frac{2}{3}. 
\]

Choose \( \eta \in D_{2R(K_1)} \) and \( \Gamma_{3R} = \partial D_{3R(K_1)} \), we get from Cauchy’s integral formula that
\[
|\hat{u}(\eta)| = \left| i\frac{\delta i\eta + \hat{f}(\eta)}{(p - \eta + \eta^3)} \right| = \left| \frac{1}{2\pi i} \int_{\Gamma_{3R}} \frac{i(\delta i\zeta + \hat{f}(\zeta))}{(p - \zeta + \zeta^3)(\zeta - \eta)} d\zeta \right|.
\]

On the one hand, since
\[
|\hat{f}(\zeta)| \leq e^{3LR} \int_{0}^{L} |f(x)| dx < e^{3LR}L^{1/2}, \quad \forall \zeta \in D_{3R},
\]

\[
|(p - \zeta + \zeta^3)(\zeta - \eta)| \geq (26K_2 + \frac{52}{3})R = \frac{52}{3}R^4, \quad \forall \zeta \in \partial D_{3R}, \forall \eta \in D_{2R},
\]
we have
\[
|\hat{u}(\eta)| \leq \frac{1}{2\pi} \left| \int_{\Gamma_{3R}} \frac{\delta i\zeta}{(p - \zeta + \zeta^3)(\zeta - \eta)} d\zeta \right| + \frac{1}{2\pi} \left| \int_{\Gamma_{3R}} \frac{\hat{f}(\zeta)}{(p - \zeta + \zeta^3)(\zeta - \eta)} d\zeta \right| \leq \left( \frac{27}{52R^2} + \frac{9L^{1/2}e^{3LR}}{52R^3} \right) \gamma. \tag{3.3}
\]

On the other hand, for \( \forall \xi \in (D_{2R})^c \) we have
\[
|p - \xi - \xi^3| \geq \frac{2}{3}|\xi|^3 + \frac{1}{3}|\xi| \geq \frac{16}{3}R^3 - \frac{2}{3}R > \frac{14}{3}R^3,
\]

\[
\frac{|\xi|}{|p - \xi - \xi^3|} \leq \frac{|\xi|}{\frac{2}{3}|\xi|^3 - \frac{1}{3}|\xi|} < \frac{12}{7|\xi|^2},
\]

respectively.
thus

\[ |\hat{u}(\xi)| \leq \frac{12\gamma}{7|\xi|^2} + \frac{3}{14}|\hat{f}(\xi)|, \quad \forall \xi \in (D_{2R})^c, \]

which, together with (3.3), yields

\[
\int_{\mathbb{R}} |\hat{u}(\xi)|^2 d\xi = \int_{\xi \in [-2R,2R]} |\hat{u}(\xi)|^2 d\xi + \int_{\xi \in [-2R,2R]^c} |\hat{u}(\xi)|^2 d\xi,
\]

\[
\leq 4R \left( \frac{27}{52R^2} + \frac{9L^{1/2}e^{3LR}}{52R^3} \right)^2 \gamma^2 + \frac{24}{49} \gamma^2 + \frac{9}{49} \gamma^2,
\]

\[
\leq \left( 4R \left( \frac{27}{52R^2} + \frac{9L^{1/2}e^{3LR}}{52R^3} \right)^2 + \frac{57}{98} \right) \gamma^2.
\]

This contradicts our assumption that \( \|u\|_{L^2} = 1 \), provided \( \gamma \) small enough:

\[
\left( 4R \left( \frac{27}{52R^2} + \frac{9L^{1/2}e^{3LR}}{52R^3} \right)^2 + \frac{57}{98} \right) \gamma^2 < 2\pi.
\]

Furthermore, by a simple variation of the preceding argument, we infer the existence of \( \alpha_*(L, K_1) > 0 \) such that

\[ |\alpha| + |\beta| \geq \alpha_*(L, K_1) \]

is forced by the normalisation condition on \( u \). Indeed, based on the above estimates with \( (\alpha, \beta) = (0, 0) \), when \( (\alpha, \beta) \neq (0, 0) \), for \( \eta \in D_{2R} \) we have

\[
|\hat{u}(\eta)| = \left| \frac{\alpha - \beta e^{-iL\eta} + \delta i\eta + \hat{f}(\eta)}{(p - \eta + \eta'^3)} \right|
\]

\[
= \left| \frac{1}{2\pi} \int_{3R} \frac{\alpha - \beta e^{-iL\zeta} + \delta i\zeta + \hat{f}(\zeta)}{(p - \zeta + \zeta'^3)(\zeta - \eta)} d\zeta \right|
\]

\[
\leq \left( \frac{27}{52R^2} + \frac{9L^{1/2}e^{3LR}}{52R^3} \right) \gamma + \frac{9}{52R^3} \left( |\alpha| + e^{3LR} |\beta| \right),
\]

and for \( \xi \in (D_{2R})^c \cap \mathbb{R} \) we have

\[
|\hat{u}(\xi)| \leq \frac{12\gamma}{7|\xi|^2} + \frac{3}{14}|\hat{f}(\xi)| + \frac{12(|\alpha| + |\beta|)}{7|\xi|^3},
\]

which imply that

\[
\int_{\mathbb{R}} |\hat{u}(\xi)|^2 d\xi = \int_{\xi \in [-2R,2R]} |\hat{u}(\xi)|^2 d\xi + \int_{\xi \in [-2R,2R]^c} |\hat{u}(\xi)|^2 d\xi,
\]

\[
\leq 8R \left( \frac{27}{52R^2} + \frac{9L^{1/2}e^{3LR}}{52R^3} \right)^2 \gamma^2 + 8R \left( \frac{9}{52R^3} \left( |\alpha| + e^{3LR} |\beta| \right) \right)^2,
\]

\[
+ \frac{36}{49} \gamma^2 + \frac{27}{196} \gamma^2 + \frac{27(|\alpha| + |\beta|)^2}{245},
\]
\[
\begin{align*}
\leq & \left( 8R \left( \frac{27}{52R^2} + \frac{9L^{1/2}e^{3LR}}{52R^3} \right)^2 + \frac{171}{196} \right) \gamma^2, \\
& + \left( \frac{81e^{6LR}}{338R^5} + \frac{27}{245} \right) (|\alpha| + |\beta|)^2.
\end{align*}
\]

Thus

\[
\left( \frac{81e^{6LR}}{169R^5} + \frac{54}{245} \right) (|\alpha| + |\beta|)^2 \geq 1,
\]

\[
\alpha_* = \left( \frac{81e^{6LR}}{169R^5} + \frac{54}{245} \right)^{-1/2},
\]

provided that

\[
\left( 8R \left( \frac{27}{52R^2} + \frac{9L^{1/2}e^{3LR}}{52R^3} \right)^2 + \frac{171}{196} \right) \gamma^2 \leq 2\pi - 1.
\]

Moreover, by shrinking \(\gamma_0(L, K_1)\) if necessary this can be easily improved to

\[
|\beta|/2 \leq |\alpha| \leq 2|\beta| \quad \text{and} \quad \min\{|\alpha|, |\beta|\} \geq \frac{1}{3} \alpha_*(L, K_1).
\]

Since else we can arrange the numerator not to have any zeroes at all on or near the real axis, while as shown in the beginning that \(\lambda = iR + \mathcal{O}(2\gamma)\), whence there exists at least one root of the denominator that is near the real axis for small \(\gamma\). More precisely, we only need to show the former relation as it leads to the latter one, if which is not true, then either

\[
|\alpha| < |\beta|/2 \quad \text{with} \quad |\beta| \geq 2/3\alpha_*,
\]

or

\[
|\alpha| > 2|\beta| \quad \text{with} \quad |\alpha| \geq 2/3\alpha_*.\]

For the first case, the zeroes of the numerator that lie in \(D_R\) satisfy

\[
\beta e^{-iL\xi} = \alpha + \delta i\xi + \hat{f}(\xi), \quad (3.4)
\]

thus

\[
|\beta|e^{\text{Im}(\xi)} \leq |\beta|e^{-iL\xi} \leq |\beta|/2 + \gamma R + \gamma L^{1/2}e^{LR},
\]

therefore,

\[
\text{Im}(\xi) \leq \frac{1}{L} \log(\frac{3}{4}),
\]
provided that $\gamma$ satisfies
\[ \gamma \left( R + L^{1/2}e^{LR} \right) \leq \frac{\alpha_0}{6}. \]

While for the latter case,
\[-\alpha = -\beta e^{-iL\xi} + \delta i\xi + \hat{f}(\xi),\]

\[ |\alpha| \leq \frac{|\alpha|}{2} e^{L\text{Im}(\xi)} + \gamma R + \gamma L^{1/2} e^{LR}, \]

therefore
\[ \text{Im}(\xi) \geq \frac{1}{L} \log(\frac{3}{2}), \]

provided that $\gamma$ satisfies
\[ \gamma \left( R + L^{1/2} e^{LR} \right) \leq \frac{\alpha_0}{6}. \]

Hence, the zero $\xi$ in $D_R$, which exists as $\hat{u}$ is holomorphic, should verify $L|\text{Im}(\xi)| \geq \log(\frac{4}{3})$.

On the other hand, we turn to the zeroes of the denominator, which all lie in $D_R$.

\[ p - \xi + \xi^3 = 0, \]

where $p \in \mathbb{R} + iO(2\gamma), \xi \in D_R$. Suppose that $p$ is given by $a + ib$ with some $|a| < K_2$ and $|b| < 2\gamma$, we can find some $\xi_0 \in D_R \cap \mathbb{R}$ as solution of $a - \xi_0 + \xi_0^3 = 0$. Therefore, there exists a solution $\xi = \xi_0 + r$ of $a + ib - \xi + \xi^3 = 0$ with $|r| < 3\gamma$, thus $|\text{Im}(\xi)| < 3\gamma$, which is in contradiction with $L|\text{Im}(\xi)| \geq \log(\frac{4}{3})$ if $\gamma$ verifies $3\gamma L \leq \log(\frac{4}{3})$.

Consider then the numerator $\alpha - \beta e^{-iL\xi} + \delta i\xi + \hat{f}(\xi)$, we can then assume that all the roots of $\alpha - \beta e^{-iL\xi} + \delta i\xi + \hat{f}(\xi)$ in $D_R$ are simple, and have to be of distance $O_K(1, L(\gamma))$ from the roots of

\[ \alpha - \beta e^{-iL\xi}, \]

which, thanks to the fact that $|\beta|/2 \leq |\alpha| \leq 2|\beta|$, are of the form
\[ \mu_0 + \frac{2\pi n}{L}, \text{ with } |\text{Re}(\mu_0)| \leq \frac{\pi}{L}, |\text{Im}(\mu_0)| \leq \frac{\log 2}{L}, \text{ and } n \in \mathbb{Z}. \] (3.5)

In fact, as
\[ \left( \alpha - \beta e^{-iL\xi} + \delta i\xi + \hat{f}(\xi) \right)' = iL\beta e^{-iL\xi} + i\delta - i\hat{f}(x)(\xi), \]

if there exists some double solution $\xi$ in $D_R$, then
\[ \frac{\alpha L}{3} e^{-LR} \leq |iL\beta e^{-iL\xi}| \leq \left( 1 + \left( \frac{L^3}{3} \right)^{1/2} e^{LR} \right) \gamma, \]
contraction when

\[
\left( 1 + \left( \frac{L^3}{3} \right)^{1/2} e^{LR} \right) \gamma < \frac{\alpha_s L}{3} e^{-LR}.
\]

Furthermore, if \( \mu \) is such a zero of \( \alpha - \beta e^{-iL\xi} \) that is in \( D_R \), we pick a circle \( \Gamma_r(\mu) \) in the complex plane centred at \( \mu \) of radius \( r \in (0, \min\{\frac{\pi}{8L}, R\}) \). We prove that under certain conditions, which will be chosen later on, there is only one solution of \( \alpha - \beta e^{-iL\xi} + \delta \xi + \hat{f}(\xi) \) that lies in the domain \([ -\frac{\pi}{L} + \text{Re}(\mu), \frac{\pi}{L} + \text{Re}(\mu) ] \times \mathbb{R} \), actually this solution is inside \( \Gamma_r(\mu) \).

At first for any \( \xi \in \Gamma_r(\mu) \) we have

\[
|\alpha - \beta e^{-iL\xi}|^2 = |(\alpha - \beta e^{-iL\xi}) - (\alpha - \beta e^{-iL\mu})|^2
= |\beta e^{-iL\mu} (e^{-iL\xi} - 1)|^2,
= |\alpha|^2 ((\cos(L\alpha)e^{Lr} - 1)^2 + (\sin(L\alpha)e^{Lrb})^2),
\]

where \( \xi_r = \xi - \mu = a + ib \) with \( a^2 + b^2 = 1 \).

If \( |a| \geq \frac{3}{8} \), then \( (\sin(L\alpha)e^{Lrb})^2 \geq (e^{-LrLr} \frac{1}{288})^2 \geq (\frac{Lr}{144})^2 \).

If \( |a| \leq \frac{3}{8} \), then \( |b| \geq \frac{7}{8} \). If further \( b < 0 \), then \( (\cos(L\alpha)e^{Lrb} - 1)^2 \geq (1 - e^{-2Lr/3})^2 \geq (\frac{Lr}{48})^2 \). Else \( b > 0 \), thus \( (\cos(L\alpha)e^{Lrb} - 1)^2 \geq (\frac{Lr}{12})^2 \).

Therefore,

\[
|\alpha - \beta e^{-iL\xi}| \geq \frac{|\alpha| Lr}{48} \geq \frac{\alpha_s Lr}{144}, \quad \forall \xi \in \Gamma_r(\mu),
\]

which yields

\[
|\alpha - \beta e^{-iL\xi} + \delta i \xi + \hat{f}(\xi)| \geq \frac{\alpha_s Lr}{288}, \quad \forall \xi \in \Gamma_r(\mu),
\]

if

\[
\gamma \left( R + L^{1/2} e^{LR} \right) \leq \frac{\alpha_s Lr}{288}.
\]

Moreover, under the above condition, there is no solution in \([ -\frac{\pi}{L} + \text{Re}(\mu), \frac{\pi}{L} + \text{Re}(\mu) ] \times \mathbb{R} \setminus D_r(\mu) \). Indeed, for any \( \xi \in D_r \cap \left[ -\frac{\pi}{L} + \text{Re}(\mu), \frac{\pi}{L} + \text{Re}(\mu) \right] \times \mathbb{R} \), we estimate \( \alpha - \beta e^{-iL\xi} \) by two situations:

if \( |\text{Im}(\xi - \mu)| \geq r/2 \), then

\[
|\alpha - \beta e^{-iL\xi}| = |\alpha| |e^{-iL(\xi - \mu)} - 1| \geq \frac{\alpha_s}{3} |e^{L\text{Im}(\xi - \mu)} - 1| \geq \frac{\alpha_s Lr}{48},
\]

if \( |\text{Re}(\xi - \mu)| \geq r/2 \) and \( |\text{Im}(\xi - \mu)| \leq r/2 \), then

\[
|\alpha - \beta e^{-iL\xi}| = |\alpha| |e^{-iL(\xi - \mu)} - 1| \geq |\alpha| |e^{L\text{Im}(\xi - \mu)}| \sin(\text{Re}(\xi - \mu)L) \geq \frac{\alpha_s Lr}{24}.
\]

Next we prove that, shrinking the upper bound on \( \gamma \) if necessary, there is exactly one solution inside \( \Gamma_r(\mu) \). As demonstrated before, there is no solution on \( \Gamma_r(\mu) \), therefore the number of solutions (counting multiplicity)
Thus it suffices to let
\[ \frac{1}{2\pi i} \int_{\Gamma_r(\mu)} \frac{(\alpha - \beta e^{-iL\xi} + \delta i\xi + \hat{f}(\xi))'}{\alpha - \beta e^{-iL\xi} + \delta i\xi + \hat{f}(\xi)} \, d\xi = \frac{1}{2\pi i} \int_{\Gamma_r(\mu)} \frac{iL\beta e^{-iL\xi} + i\delta - i(\hat{f})(\xi)}{\alpha - \beta e^{-iL\xi} + \delta i\xi + \hat{f}(\xi)} \, d\xi. \]

As \( \mu \) is the only solution of \( \alpha - \beta e^{-iL\xi} = 0 \) inside \( \Gamma_r(\mu) \), we also have
\[ 1 = \frac{1}{2\pi i} \int_{\Gamma_r(\mu)} \frac{(\alpha - \beta e^{-iL\xi})'}{\alpha - \beta e^{-iL\xi}} = \frac{1}{2\pi i} \int_{\Gamma_r(\mu)} \frac{iL\beta e^{-iL\xi}}{\alpha - \beta e^{-iL\xi}} \, d\xi. \]

It suffices to find a sufficient condition such that
\[ N_r := \left| \frac{1}{2\pi i} \int_{\Gamma_r(\mu)} \frac{(iL\beta e^{-iL\xi})(\delta i\xi + \hat{f}(\xi))}{(\alpha - \beta e^{-iL\xi} + \delta i\xi + \hat{f}(\xi))(\alpha - \beta e^{-iL\xi})} \, d\xi - \frac{1}{2\pi i} \int_{\Gamma_r(\mu)} \frac{iL\beta e^{-iL\xi}}{\alpha - \beta e^{-iL\xi}} \, d\xi \right|, \]
is strictly smaller than 1, since \( N_r \) takes value from integer. In fact, under the above conditions, thanks to the above known estimates, we have
\[
N_r \leq \frac{1}{2\pi} \int_{\Gamma_r(\mu)} \left( \frac{(iL\beta e^{LR})(\delta i\xi + \hat{f}(\xi))}{(\alpha - \beta e^{-iL\xi} + \delta i\xi + \hat{f}(\xi))(\alpha - \beta e^{-iL\xi})} \, d\xi + \frac{1}{2\pi} \int_{\Gamma_r(\mu)} \frac{i\delta - i(\hat{f})(\xi)}{\alpha - \beta e^{-iL\xi} + \delta i\xi + \hat{f}(\xi)} \, d\xi \right)
\]
\[
\leq r \left( \frac{(L\beta e^{LR})\gamma(R + L^{1/2}e^{LR})}{\alpha_s \alpha L} + \left( 1 + \left( \frac{L^3}{3} \right)^{1/2} e^{LR} \right) \right) \frac{\alpha_s L}{288},
\]
\[
\leq \frac{r}{288} \cdot 48 \beta e^{LR} \frac{R + L^{1/2}e^{LR}}{\alpha_s \alpha L} + \gamma \cdot \frac{288 \left( 1 + \left( \frac{L^3}{3} \right)^{1/2} e^{LR} \right)}{\alpha_s L},
\]
\[
\leq 288 \gamma \left( \frac{96e^{LR} (R + L^{1/2}e^{LR})}{\alpha_s L} + 1 + \left( \frac{L^3}{3} \right)^{1/2} e^{LR} \right) \alpha_s L.
\]

Thus it suffices to let \( \gamma \) satisfy
\[
288 \gamma \left( \frac{96e^{LR} (R + L^{1/2}e^{LR})}{\alpha_s L} + 1 + \left( \frac{L^3}{3} \right)^{1/2} e^{LR} \right) < 1.
\]

We conclude that all the zeroes of the numerator \( \alpha - \beta e^{-iL\xi} + \delta i\xi + \hat{f}(\xi) \) in \( D_R \) are of the form
\[
\mu_0 + k \frac{2\pi}{L} + O(r), \ k \in \mathbb{Z},
\]
where \( \mu_0 \) satisfies \( |\mu_0| \leq \frac{2\pi}{L} \). Because all the zeroes of the denominator, which are in \( D_R \), should also be solutions of the numerator, amongst those solutions have to be the roots of the polynomial \( p - \xi + \xi^3 \). Picking \( \xi_0 \) suitably,
we may assume that the roots of this polynomial in $D_R$ are then of the form

$$\xi_0, \xi_1 = \xi_0 + k \frac{2\pi}{L} + 2\mathcal{O}(r), \xi_2 = \xi_0 + (k + l) \frac{2\pi}{L} + 2\mathcal{O}(r),$$

where $k, l$ are positive integers. Observe that necessarily we have

$$|\xi_i| \leq R, \ (k + l) \frac{2\pi}{L} | \leq 2R + 1/4.$$

Then one infers the system

$$\xi_0 + \xi_1 + \xi_2 = 0, \xi_0\xi_1 + \xi_0\xi_2 + \xi_1\xi_2 = -1, \xi_0\xi_1\xi_2 = -p,$$

and the first two of these equations yield

$$3\xi_0 + \frac{2\pi}{L}(2k + l) + 4\mathcal{O}(r) = 0,$$

$$3 = \left(\frac{2\pi}{L}\right)^2(k^2 + kl + l^2) + \frac{2\pi}{L}(28k + 10l)\mathcal{O}(r) + 36\mathcal{O}(r^2).$$

Thus

$$|L^2 - \left(2\pi\sqrt{\frac{k^2 + l^2 + kl}{3}}\right)|^2 \leq 56L^2(R + 1/8)r + 36L^2r^2 \leq 56L^2(R + 1)r.$$
\[
\gamma \left( R + L^{1/2} e^{L R} \right) \leq \frac{\alpha_* L r}{288}, \
288 \gamma \left( \frac{96 e^{L R} (R + L^{1/2} e^{L R})}{\alpha_* L r} + 1 + \left( \frac{L^3}{\pi} \right)^{1/2} e^{L R} \right) < 1.
\]

Now we turn to the second proposition and begin with outlining the idea of the proof. Assume that there is a \( u \), \( \|u\|_{L^2} = 1 \) as in Proposition 1.3 satisfying flux inequality (1.3). Heuristically, we shall now construct a finite dimensional vector space \( V \subset H^3(0, L) \) of functions satisfying the desired boundary vanishing conditions and such that

\[
\| \Pi_V Af - Af \| < \gamma \| f \|. \tag{3.6}
\]

Moreover, this vector space admits an orthonormal basis in \( A \), such that \( \Pi_{CV} A|_{CV} \) has a normalised (complex) eigenvector with \( \|u\|_{H^3} \leq B^2(L, K)K =: K_1 \), and which then implies Proposition 1.3. More precisely, thanks to Corollary 2.7, suppose that \( \{g_1, g_2, \ldots, g_p\} \) with \( p \leq B(L, K) \) is an orthonormal basis of \( V \),

\[
g_j(0) = g_j(L) = (g_j)_x(L) = 0, \quad \| (g_j)_x(0) \| < \frac{\gamma}{\sqrt{B(L, K)}}, \tag{3.8}
\]

\[\| g_j \| = 1, \quad \| g_j \|_{H^3} \leq K, \tag{3.9}\]

\[A g_j \in V, \quad \forall j \in \{1, 2, \ldots, p - 1\}, \tag{3.10}\]

\[\| A g_p - \Pi_V A g_p \| < \gamma, \tag{3.11}\]

then the vector space \( V \) and the complex vector space \( CV \) satisfies

\[
\| \Pi_V Af - Af \| < \gamma \| f \|, \quad \forall f \in V,
\]

\[
\| \Pi_{CV} Af - Af \| < \gamma \| f \|, \quad \forall f \in CV,
\]

\[\Pi_{CV} A : CV \longrightarrow CV.\]

As \( CV \) is of finite dimension, the map \( \Pi_{CV} A \) admits at least one eigenvalue:

\[
g := \sum_{j=1}^{p} a_j g_j \in CV, \quad \Pi_{CV} A g = \lambda g, \quad \sum_{j=1}^{p} |a_j|^2 = 1,
\]

which further satisfies

\[
\| \lambda g - A g \| = \| \Pi_{CV} A g - A g \| < \gamma \| g \| = \gamma,
\]

\[
\| g \|_{H^3} \leq \sum_{j=1}^{p} |a_j| \| g_j \|_{H^3} \leq B^2(L, K)K = K_1,
\]

\[
g(0) = g(L) = g_x(L) = 0, \quad |g_x(0)| \leq \sum_{j=1}^{p} |a_j| \| (g_j)_x(0) \| < \gamma,
\]

therefore \( g \in B_\gamma \).
Keeping in mind the above essential observation, in the following complete proof we will only need to construct orthonormal functions \( \{g_j\} \) verifying conditions (3.7)–(3.11).

**Proof of Proposition 1.3.**

**Step 0:** In the first part, we present some basic properties of the flow, while some of them are based on the “smallness” of the flux. The remaining parts of the proof are basically repeating these key observations.

**Observation (i).** Set \( K_0 = K_0(L) \) by \((2F_s^2 / K_0)^{2/3} = 1\), define \( K_1 := K_1(L, K_0) \), and pick \( t_1 = t_1(K) := (2F_s^2 / K)^{2/3} \in (0, 1) \) for \( K \geq K_0 \). From now on we will work on \( K \geq K_0 \), which actually will give us a result slightly stronger than Proposition 1.3. As a consequence, Proposition 1.3 will be concluded by selecting \( K = K_0 \). Thanks to Lemmas 2.4 and 2.1, the flow \( S(t) \) satisfies, for \( \forall t \in [t_1, +\infty) \),

\[
|S(t)f|_{H^3([0, L])] \leq \frac{F_s^3}{t_1^{3/2}} \|f\| \leq \frac{K}{2} \|f\|,
\]

\[
|S(t)f|_{H^6([0, L])] \leq \frac{F_s^6}{t_1} \|f\| \leq \frac{K^2 F_s^6}{4(F_s^2)^3} \|f\|,
\]

\[
|AS(t)f|_{L^2(0, L]} \leq \frac{K(1 + \sqrt{E_3^3})\|f\|}{2} < \bar{K}\|f\|,
\]

\[
|AS(t)f|_{H^3(0, L]} \leq \frac{K^2 F_s^6 (1 + \sqrt{E_3^3})\|f\|}{4(F_s^2)^3} < \bar{K}\|f\|,
\]

\[
|A^2S(t)f|_{L^2(0, L]} \leq \left( \frac{K^2 F_s^6 (1 + 2 \sqrt{E_3^3})}{4(F_s^2)^3} + \frac{K \sqrt{E_3^3}}{2} \right) \|f\| =: \bar{K}\|f\|.
\]

**Observation (ii).** Another important observation is that the \( L^2 \) norm of the flow stays close to its initial value, thanks to (2.2):

\[
\|f(t)\| = \|f_0\| + \mathcal{O}\left( \frac{\int_0^T \|f_s^2(t, 0)\| \, dt}{\|f_0\|} \right), \forall t \in [0, T].
\]

For instance, if \( \|f_0\| = 1 \) and the flux \( \int_0^T f_s^2(t, 0) \, dt < a \), then the energy of the flow stays close to 1: \( \|S(t)f\| \in [1 - a, 1] \).

**Observation (iii).** Owning to the strong regularity of \( S(t)u \), we are able to estimate \( S(s)u - S(t)u \). More precisely, for any \( \delta \in (0, 1/2) \) and any \( t \in [t_1, +\infty) \), direct calculation implies,

\[
S(t + \delta)f - S(t)f = \int_t^{t+\delta} S'(s)f \, ds = \delta S'(t)f + \int_t^{t+\delta} \int_s^t S''(r) \, dr \, ds,
\]

thus

\[
\frac{S(t + \delta)f - S(t)f}{\delta} = AS(t)f + \bar{K}O_{L^2}(\delta)\|f\|, \forall t \in [t_1, +\infty).
\]
Observation (iv). Thanks to the relation (3.12), we can estimate the flux of $A(t)$. Assuming $\int_0^T f_x^2(t,0) \, dt < a < 1/2$ and $\delta \in (0,t_1)$, we have that, for any $t \in [t_1,T-t_1-\delta]$,

$$
\int_0^{T-t_1} \left( S(s)(AS(t)f) \right)^2 x (0) \, ds, \\
\leq \int_0^{T-t_1} \left( S(s)(AS(t)f) \right)^2 x (0) \, ds, \\
= \int_0^{T-t_1} \left( S(s) \left( \frac{S(t+\delta)f - S(t)f}{\delta} - \tilde{K}O_{L^2}(\delta)\|f\| \right) \right)^2 x (0) \, ds, \\
= \int_0^{T-t_1} \left( \frac{1}{\delta} S(s)(S(t+\delta)f) - \frac{1}{\delta} S(s)(S(t)f) - S(s) \left( \tilde{K}O_{L^2}(\delta)\|f\| \right) \right)^2 x (0) \, ds, \\
\leq 3 \int_0^{T-t_1} \left( \frac{1}{\delta} S(s)(S(t+\delta)f) \right)^2 x (0) + \left( \frac{1}{\delta} S(s)(S(t)f) \right)^2 x (0) + \left( S(s) \left( \tilde{K}O_{L^2}(\delta)\|f\| \right) \right)^2 x (0) \, ds, \\
\leq 3 \tilde{K}^2 \delta^2 \|f\|^2 + \frac{6a}{\delta^2} \int_t^T (S(t')f)^2 (0) \, dt', \\
\leq 3 \tilde{K}^2 \delta^2 \|f\|^2 + \frac{6a}{\delta^2}.
$$

Observation (v). Observe that $A(t)$ and $f(t)$ are orthogonal, provided the null flux, i.e. $\int_0^T f_x^2(t,0) \, dt = 0$,

$$
\langle A(t), f(t) \rangle = \langle -f_x - f_{xxx}, f \rangle = -\frac{f_x^2(t,0)}{2}, \\
\langle A(t), f(t) \rangle = \langle \frac{d}{dt} f(t), f(t) \rangle = \frac{1}{2} \frac{d}{dt} \|f(t)\|^2 = 0.
$$

Thus it is natural to have a perturbed version, $A(t)$ and $f(t)$ are “almost” orthogonal when the flux is small. Suppose that $\int_0^T f_x^2(t,0) \, dt < a$, then for any $t \in [t_1,T-\delta]$, any $\delta \in (0,1/2)$, we have

$$
\langle S(t)f, AS(t)f \rangle, \\
= \left\langle S(t)f, \frac{S(t+\delta)f - S(t)f}{\delta} - \tilde{K}O_{L^2}(\delta)\|f\| \right\rangle, \\
= \tilde{K}O(\delta)\|f\|^2 + \left\langle S(t)f, \frac{S(t+\delta)f - S(t)f}{\delta} \right\rangle, \\
= \tilde{K}O(\delta)\|f\|^2 + \frac{1}{2\delta} \left( \langle S(t)f - S(t+\delta)f, S(t+\delta)f - S(t)f \rangle + \langle S(t)f + S(t+\delta)f, S(t+\delta)f - S(t)f \rangle \right), \\
= \tilde{K}O(\delta)\|f\|^2 + \frac{\mathcal{O}(\delta)}{2} \|AS(t)f + \tilde{K}O_{L^2}(\delta)\|f\||^2 + \frac{1}{2\delta} \left( \|S(t+\delta)f\|^2 - \|S(t)f\|^2 \right), \\
= \tilde{K}O(\delta)\|f\|^2 + \mathcal{O}(\delta) \left( \tilde{K}^2 + \tilde{K}^2 \delta^2 \right) \|f\|^2 + \frac{\mathcal{O}(a)}{2\delta}, \\
= \mathcal{O} \left( 4\delta \tilde{K}^2 \|f\|^2 + \frac{a}{2\delta} \right),
$$

which is small provided that $a \ll \delta \ll 1$. 
Observation (vi). If two small flux flows are orthogonal at the beginning, then they are “almost” orthogonal along the flow. Indeed, suppose that for some $a < 1/2$ we have
\[
\int_0^T (S(t)f)^2_x(0) \, dt < a, \quad \int_0^T (S(t)g)^2_x(0) \, dt < a,
\]
then direct integration by parts shows
\[
\langle S(t)f, S(t)g \rangle - \langle f, g \rangle = \int_0^t \frac{d}{dt} \langle S(s)f, S(s)g \rangle \, ds,
\]
\[
= \int_0^t \langle AS(s)f, S(s)g \rangle + \langle S(s)f, AS(s)g \rangle \, ds,
\]
\[
= -\int_0^t (S(s)f)_x(0)(S(s)g)_x(0) \, ds,
\]
\[
= O(a), \quad \forall t \in [0, T].
\]

Observation (vii). Let $V$ be a subspace of $L^2$. Then
\[
\| \Pi_{S(t)V}^\perp S(t)f \| \leq \| \Pi_V^\perp f \|.
\]
Indeed, there exists a $f_1 \in V$ such that
\[
f = f_1 + g, \quad g = \Pi_V^\perp f,
\]
in view of the linearity of the flow, we have
\[
S(t)f = S(t)f_1 + S(t)g.
\]
Because $S(t)f_1 \in S(t)V$, the projection satisfies,
\[
\| \Pi_{S(t)V} S(t)f \| \leq \| S(t)g \| \leq \| g \| = \| \Pi_V^\perp f \|.
\]

Remark 3.1. If the flux small condition is replaced by the null flux condition, then all these observations become even better.

From now on we will present the constructive approach to find orthonormal functions $\{g_j\}$ verifying conditions (3.7)–(3.11), following the commutative diagram in Figure 1.

Step 1: In particular, we have that $u$ and $g_{11} := S(t_1)u$ satisfy
\[
\|g_{11}\|_{H^s} \leq \frac{K}{2},
\]
\[
\|g_{11}\|_{L^2([0,L])} = 1 + O(\varepsilon),
\]
\[
\frac{S(t_1 + \delta)u - S(t_1)u}{\delta} = Ag_{11} + K\mathcal{O}_{L^2}(\delta), \forall \delta \in (0, 1/2),
\]  
(3.13)
the second inequality on account of the flux assumption on $u$, and the third is small for some very small $\delta_1$, which, however, is much larger than $\varepsilon$. 
If

\[ \|Ag_{11}\| < \frac{\gamma}{2}, \]

then stop. We further define 

\[ g_{11}(s) := S(t_1 + s)u = S(s)g_{11}, s \in [0, t_1], \]

which satisfies

\[ \|g_{11}(s)\|_{H^3} \leq K, \|g_{11}(s)\|_{L^2([0,L])} = 1 + O(\varepsilon), \]

\[ \|Ag_{11}(s)\| = \|S(s)Ag_{11}\| \leq \|Ag_{11}\| < \frac{\gamma}{2}, \]

\[ \int_0^{t_1} (g_{11}(s))^2(0) ds = \int_{t_1}^{2t_1} (S(t)u)^2(0) dt \leq \int_0^T (S(t)u)^2(0) dt \leq \varepsilon, \]

hence there exists \( s \) such that \( |g_{11}(s)(x)(0)| \leq (\varepsilon/t_1)^{1/2} \). Observe that if we set 

\[ y_{11} := \frac{g_{11}(s)}{\|g_{11}(s)\|}, V := \text{span}\{y_{11}\}, \]

then

\[ \|y_{11}\| = 1, \|y_{11}\|_{H^3} \leq K, \]

\[ y_{11}(0) = y_{11}(L) = (y_{11})_x(L) = 0, |(y_{11})_x(0)| < \frac{\gamma}{\sqrt{B(L,K)}}, \]

\[ \|Ay_{11} - \Pi_V Ay_{11}\| \leq \|Ay_{11}\| < \gamma, V = \text{span}\{y_{11}\}, \]

if \( \varepsilon < 1/18 \) satisfies

\[ 3 \frac{\varepsilon}{2\sqrt{t_1}} < \frac{\gamma}{\sqrt{B(L,K)}}. \]

As a consequence, conditions (3.7)–(3.11) hold with \( p = 1, g_1 = y_{11} \), which, as it is shown at the beginning, implies that \( B_\gamma \neq \emptyset \).

If on the other hand we have

\[ \|Ag_{11}\| \geq \frac{\gamma}{2}, \]
then proceed to the next step.

**Step 2:** Now we have \(\|Ag_{11}\| \geq \frac{\gamma}{2}\). For ease of notations, we define the following \(L^2\)-normalization operator:

\[
\mathcal{L} : f \rightarrow \frac{f}{\|f\|}, \ \forall f \neq 0.
\]

It can be easily checked that \(\mathcal{L}\) verifies

\[
\mathcal{L}S(t) = \mathcal{L}(t) \mathcal{L}, \ \mathcal{L}A = \mathcal{L}AC.
\]

Set

\[
y_{21} = \mathcal{L}Ag_{11}.
\]

First we recall some properties of \(y_{11}\) and \(y_{21}\), thanks to the observations in *Step 0*:

\[
\|y_{11}\| = \|y_{21}\| = 1, \ \sqrt{1 - \varepsilon} \leq \|g_{11}\| \leq 1, \ \|Ag_{11}\| \geq \frac{\gamma}{2},
\]

\[
\langle g_{11}, Ag_{11} \rangle \leq 4\delta \bar{K}^2 + \frac{\varepsilon}{2\delta}, \ \forall \delta \in (0, 1/2),
\]

\[
\langle y_{11}, y_{21} \rangle \leq 4\delta \bar{K}^2 + \frac{\varepsilon}{2\delta}, \ \forall \delta \in (0, 1/2), \quad (3.14)
\]

\[
\int_0^{T-t_1} (S(s)y_{11})^2_x(0) \, ds = \frac{1}{\|g_{11}\|^2} \int_0^T (S(s)y_{11})^2_x(0) \, ds \leq 2\varepsilon. \quad (3.15)
\]

Despite that the normalized function \(y_{21}\) may have a poor \(H^2\)-bound, its boundary trace at \(x = 0\) is small in the sense that, \(\forall \delta \in (0, t_1),\)

\[
\int_0^{T-2t_1} (S(s)Ag_{11})^2_x(0) \, ds = \int_0^{T-2t_1} (S(s)(AS(t)u))^2_x(0) \, ds \leq 3\delta^2 \bar{K}^2 + \frac{6\varepsilon}{\delta^2},
\]

\[
\int_0^{T-2t_1} (S(s)y_{21})^2_x(0) \, ds \leq \frac{1}{\|Ag_{11}\|^2} \int_0^{T-2t_1} (S(s)Ag_{11})^2_x(0) \, ds \leq \left(3\delta^2 \bar{K}^2 + \frac{6\varepsilon}{\delta^2}\right) \frac{4}{\gamma^2}, \quad (3.16)
\]

having taken advantage of observation (*iv*). For the sake of simplicity, we define an upper bound for (3.14), (3.15) and (3.16):

\[
C_1 = C_1(\varepsilon, \delta_1, \gamma, \bar{K}) := \left(\delta_1^2 \bar{K}^2 + \frac{\varepsilon}{\delta_1^2}\right) \frac{24}{\gamma^2}, \ \forall \delta_1 \in (0, \min\{\frac{1}{2}, t_1\}),
\]

which can be sufficiently small for well chosen \(\varepsilon\) and \(\delta_1\). To make it clear, \(C_1\) is an upper bound for

\[
\int_0^{T-2t_1} (S(s)y_{11})^2_x(0) \, ds, \ \int_0^{T-2t_1} (S(s)y_{21})^2_x(0) \, ds, \ \|\langle y_{11}, y_{21} \rangle\|.
\]

From the above inequality, we derive the existence of \(\tilde{t}_1 \in [t_1, 2t_1]\) such that \(\|\langle S(\tilde{t}_1)y_{11}\rangle_x(0)\|, \|\langle S(\tilde{t}_1)y_{21}\rangle_x(0)\| \leq (2C_1/t_1)^{1/2}\). Set

\[
g_{12} := S(\tilde{t}_1)y_{11}, \ g_{22} := S(\tilde{t}_1)y_{21}.
\]
They share similar properties as $y_{11}$ and $y_{21}$, thanks to the observations and the flux condition:

$$\|g_{12}\|^2, \|g_{22}\|^2 \in [1 - C_1, 1],$$
$$\|g_{12}\|_H^2, \|g_{22}\|_H^2 \leq \frac{K}{2}; \|(g_{12})_x(0)\|, \|(g_{22})_x(0)\| \leq \left(\frac{2C_1}{t_1}\right)^{1/2}.$$ 

$$\int_0^{T - 4t_1} (S(s)g_{12})_x^2(0) \, ds \leq C_1, \int_0^{T - 4t_1} (S(s)g_{22})_x^2(0) \, ds \leq C_1,$$
$$|\langle g_{12}, g_{22} \rangle| \leq 2C_1,$$
$$Ag_{12} = AS(t_1)\mathcal{L}g_{11} \in \text{span}\{g_{22}\}.$$ 

Finally we can set

$$y_{12} := \mathcal{L}g_{12}, \ y_{22} := \mathcal{L}\Pi_{y_{12}}^\perp g_{22}, \ y_{32} := \Pi_{y_{12}}^\perp Ay_{22}, \ y_{32} := \mathcal{L}y_{32}.$$ 

Notice that $y_{22}$ is obtained from the Gram-Schmidt procedure, thus

$$Ay_{12} \in \text{span}\{g_{12}, g_{22}\} = \text{span}\{y_{12}, y_{22}\}.$$ 

It can be proved that $\{y_{12}, y_{22}, y_{32}\}$ share similar properties as $\{y_{11}, y_{21}\}$: “small” flux. It is easy to get for $y_{12}$:

$$\int_0^{T - 4t_1} (S(s)y_{12})_x^2(0) \, ds \leq 2C_1.$$

As for $y_{22}$, it can be written in the form of a “prepared” flow:

$$y_{22} = \frac{1}{\|\Pi_{y_{12}}^\perp g_{22}\|} \left( g_{22} - \frac{g_{12}}{\|g_{12}\|^2} \langle g_{12}, g_{22} \rangle \right),$$
$$= \frac{1}{\|\Pi_{y_{12}}^\perp g_{22}\|} S(t_1) \left( y_{21} - \frac{\langle g_{12}, g_{22} \rangle}{\|g_{12}\|^2} y_{11} \right),$$
$$=: S(t_1) z_{22},$$

for which we can successively get,

$$\|\Pi_{y_{12}}^\perp g_{22}\|^2 = \left\| g_{22} - \frac{g_{12}}{\|g_{12}\|^2} \langle g_{12}, g_{22} \rangle \right\|^2 \in [1 - 5C_1, 1],$$

$$\|z_{22}\| \leq \frac{1 + C_1}{(1 - C_1)\sqrt{1 - 5C_1}} \leq 2,$$

$$\int_0^{T - 2t_1} (S(s)z_{22})_x^2(0) \, ds \leq \frac{8C_1}{1 - 5C_1} \leq 16C_1,$$

$$\int_0^{T - 5t_1} (S(s)AS(t_1)z_{22})_x^2(0) \, ds \leq 12\tilde{K}^2\delta^2 + \frac{96C_1}{\delta^2}, \forall \delta \in (0, t_1).$$
Thanks to the above inequalities on $z_{22}$, we can further get

$$
\|y_{22}\|_{H^3} \leq \frac{\|\Pi_{y_{22}^\perp} z_{22}\|_{H^3}}{\|\Pi_{y_{22}^\perp} z_{22}\|} \leq \frac{1}{\sqrt{1 - 5C_1}} \cdot \frac{K}{2} \frac{1}{1 - C_1} \leq K \frac{1 + 4C_1}{2\sqrt{1 - 5C_1}} \leq \frac{3K}{4},
$$

$$
\|Ay_{22}\|_{L^2} \leq \frac{\tilde{K}}{\sqrt{1 - 5C_1}} \leq 2\tilde{K},
$$

$$
\int_0^{T - 4t_1} (S(s)y_{22})_x^2(s) ds \leq \frac{8C_1}{1 - 5C_1} \leq 16C_1,
$$

if $C_1 \leq 1/18$.

About $y_{32}^\perp$ which is related to $Ay_{22}$, we know from its definition that,

$$
y_{32}^\perp = Ay_{22} - \Pi_{y_{12}} Ay_{22} = Ay_{22} - ly_{12} \text{ with } |l| \leq 2\tilde{K},
$$

thus the inner products are

$$
\langle y_{32}^\perp, y_{12} \rangle = 0,
$$

$$
\langle y_{32}^\perp, y_{22} \rangle = \langle Ay_{22}, y_{22} \rangle = \langle AS(t_1) z_{22}, S(t_1) z_{22} \rangle \leq 16\delta \tilde{K}^2 + \frac{8C_1}{\delta^2}, \forall \delta \in (0, 1/2).
$$

Moreover, the flux of $y_{32}^\perp$ can be estimated by

$$
\int_0^{T - 4t_1} (S(s)y_{32})_x^2(s) ds = \int_0^{T - 4t_1} (S(s)Ay_{22} - lS(s)y_{12})_x^2(s) ds,
$$

$$
\leq 2 \int_0^{T - 5t_1} (S(s)Ay_{22})_x^2(s) ds + 2l^2 \int_0^{T - 5t_1} (S(s)y_{12})_x^2(s) ds,
$$

$$
\leq 24\delta^2 \tilde{K}^2 + \frac{192C_1}{\delta^2} + 16\tilde{K}^2 C_1, \forall \delta \in (0, t_1).
$$

If $\|y_{32}^\perp\| < \frac{\gamma}{2}$, then stop, and we verify that $\{y_{12}, y_{22}\}$ satisfy conditions (3.7)—(3.11), thus $B_\gamma$ is not empty, provided that

$$(2C_1/t_1)^{1/2} < \gamma/\sqrt{B(L, K)}.$$

If $\|y_{32}^\perp\| \geq \frac{\gamma}{2}$, then we define $C_2 = C_2(C_1, \delta_2) = C_2(\varepsilon, \delta_1, \delta_2, \gamma, \tilde{K})$ by

$$
C_2 := \left(\frac{2}{\gamma}\right)^2 \left(24\delta_2^2 \tilde{K}^2 + \frac{192C_1}{\delta_2^2} + 16\tilde{K}^2 C_1\right), \forall \delta_2 \in (0, \min\{\frac{1}{2}, t_1\}),
$$

which is an upper bound for

$$
\int_0^{T - 5t_1} (S(s)y_{i2})_x^2(s) ds \forall i \in \{1, 2, 3\}, \text{ and } |\langle y_{32}, y_{22}\rangle|.
$$
Step 4: General induction step. In this step we provide general iteration estimates. At first we prove the following lemma.

**Lemma 3.2.** Let \( n \geq 2 \). For any \( 0 < (n+1)c_n < \min\{1/18, 1/2n\} \), any \( T_n \geq 3t_1 \), any orthonormal functions \( \{y_{1n}, \ldots, y_{nn}\} \), and any normal function \( y_{(n+1)n} \) satisfying

\[
Ay_{1n} \in \text{span}\{y_{1n}, \ldots, y_{nn}\}, \quad \forall i \in \{1, \ldots, n-1\},
\]

\[
Ay_{nn} \in \text{span}\{y_{1n}, \ldots, y_{(n-1)n}, y_{(n+1)n}\},
\]

\[
\langle y_{1n}, y_{(n+1)n} \rangle = 0, \quad \forall i \in \{1, \ldots, n-1\},
\]

\[
|\langle y_{nn}, y_{(n+1)n} \rangle| \leq c_n,
\]

\[
\int_0^{T_n} (S(s)y_{1n})_x^2(0) \, ds \leq c_n, \quad \forall i \in \{1, \ldots, n+1\},
\]

we can find orthonormal functions \( \{y_{1(n+1)}, \ldots, y_{(n+1)(n+1)}\} \) such that

\[
\|y_{(n+1)n}\|_{H^3} \leq 3K/4, \quad |\langle y_{i(n+1)n} \rangle_x(0)| \leq \frac{3}{2} \sqrt{\frac{(n+1)c_n}{t_1}},
\]

\[
\int_0^{T_n-3t_1} (S(s)y_{i(n+1)})_x^2(0) \, ds \leq 2c_n, \quad \forall i \in \{1, \ldots, n+1\},
\]

\[
Ay_{i(n+1)} \in \text{span}\{y_{1(n+1)}, \ldots, y_{(n+1)(n+1)}\}, \quad \forall i \in \{1, \ldots, n\}.
\]

Then proceeding as before, we can obtain boundary trace inequality. Observe that the projection onto \( y_{i2}^\perp \) introduces a flux term of size at most \( O(\varepsilon) \) due to our earlier boundary flux estimation for \( y_{i2} \).

Since we have lost regularity for \( y_{32} \), we regain this by applying the flow \( S(\bar{t}_2) \) again, for some \( \bar{t}_2 \in [t_1, 2] \), resulting in

\[
g_{13} = S(\bar{t}_2)y_{12}, \quad g_{23} = S(\bar{t}_2)y_{22}, \quad g_{33} = S(\bar{t}_2)y_{32}.
\]

Then we apply the Gram-Schmidt procedure, by first orthogonalizing

\[
h_{13} = g_{13}, \quad h_{23} = \Pi_{h_{13}}^\perp g_{23}, \quad h_{33} = \Pi_{\{h_{13}, h_{23}\}}^\perp g_{33} = S(\bar{t}_2)z_{33},
\]

and then normalizing

\[
y_{13} = \mathcal{L}h_{13}, \quad y_{23} = \mathcal{L}h_{23}, \quad y_{33} = \mathcal{L}h_{33}.
\]

As the demonstration in Step 2, we are able to estimate \( y_{13}, y_{23}, y_{33} \) and \( Ay_{33} \) in terms of some \( C_3 \) which only depends on \( C_2 \) and \( \delta_3 \). Then if

\[
y_{i3}^\perp := \Pi_{\{y_{i,n}, y_{23}\}}^\perp Ay_{33}, \quad \|y_{i3}^\perp\| < \frac{\gamma}{2},
\]

we stop the process. Else we continue iteratively. We ignore detailed calculation in this step, as it will be covered by the next step for general cases.

Step 3: Here we assume \( \|y_{32}\| \geq \frac{\gamma}{2} \), and set

\[
y_{32} := \mathcal{L}\Pi_{y_{12}}^\perp Ay_{22}.
\]

Then proceeding as before, we can obtain boundary trace inequality. Observe that the projection onto \( y_{i2}^\perp \) introduces a flux term of size at most \( O(\varepsilon) \) due to our earlier boundary flux estimation for \( y_{i2} \).

Since we have lost regularity for \( y_{32} \), we regain this by applying the flow \( S(\bar{t}_2) \) again, for some \( \bar{t}_2 \in [t_1, 2] \), resulting in

\[
g_{13} = S(\bar{t}_2)y_{12}, \quad g_{23} = S(\bar{t}_2)y_{22}, \quad g_{33} = S(\bar{t}_2)y_{32}.
\]

Then we apply the Gram-Schmidt procedure, by first orthogonalizing

\[
h_{13} = g_{13}, \quad h_{23} = \Pi_{h_{13}}^\perp g_{23}, \quad h_{33} = \Pi_{\{h_{13}, h_{23}\}}^\perp g_{33} = S(\bar{t}_2)z_{33},
\]

and then normalizing

\[
y_{13} = \mathcal{L}h_{13}, \quad y_{23} = \mathcal{L}h_{23}, \quad y_{33} = \mathcal{L}h_{33}.
\]

As the demonstration in Step 2, we are able to estimate \( y_{13}, y_{23}, y_{33} \) and \( Ay_{33} \) in terms of some \( C_3 \) which only depends on \( C_2 \) and \( \delta_3 \). Then if

\[
y_{i3}^\perp := \Pi_{\{y_{i,n}, y_{23}\}}^\perp Ay_{33}, \quad \|y_{i3}^\perp\| < \frac{\gamma}{2},
\]

we stop the process. Else we continue iteratively. We ignore detailed calculation in this step, as it will be covered by the next step for general cases.

Step 4: General induction step. In this step we provide general iteration estimates. At first we prove the following lemma.
Moreover, if we further project $Ay_{(n+1)(n+1)}$ on span\(\{y_{1(n+1)}, \ldots, y_{n(n+1)}\}\),

\[
y_{(n+2)(n+1)}^\perp := \Pi_{y_{1}, \ldots, y_{n(n+1)}}^\perp Ay_{(n+1)(n+1)},
\]

(3.25)

then it satisfies,

\[
\int_0^{T_n-3t_1} (S(s)y_{(n+2)(n+1)}^\perp)_x^2(0) \, ds \leq \left(\frac{\gamma}{2}\right)^2 c_{n+1},
\]

and

\[
|\langle y_{(n+1)(n+1)}, y_{(n+2)(n+1)}^\perp \rangle| \leq \left(\frac{\gamma}{2}\right)^2 c_{n+1},
\]

where $c_{n+1} = c_{n+1}(c_n, \delta_{n+1})$ is given by

\[
c_{n+1} := \left(\frac{2}{\gamma}\right)^2 (n+1) \left(6\tilde{K}^2\delta_{n+1}^2 + \frac{12c_n}{\delta_{n+1}^2} + 4\tilde{K}^2c_n\right), \forall \delta_{n+1} \in (0, \min\{1/2, t_1\}).
\]

Proof. These functions are directly constructed via the Gram-Schmidt procedure. It follows from (3.21) that

\[
\int_{t_1}^{2t_1} \left(\sum_{i=1}^{n+1} (S(s)y_{in})_x^2\right)(0) \, ds \leq (n+1)c_n,
\]

hence there exists $\bar{t}_n \in [t_1, 2t_1]$ such that

\[
\sum_{i=1}^{n+1} (S(\bar{t}_n)y_{in})_x^2(0) \leq \frac{(n+1)c_n}{t_1},
\]

(3.26)

For $i \in \{1, \ldots, n+1\}$, we define

\[
g_i(n+1) := S(\bar{t}_n)y_{in},
\]

(3.27)

which, thanks to the boundary bound condition (3.26), the flux condition (3.21), Observation (i), and Observation (vi), satisfies

\[
1 - c_n \leq \|g_i(n+1)\| \leq 1, \|g_i(n+1)\|_{H^3} \leq K/2,
\]

\[
g_i(n+1)(0) = g_i(n+1)(L) = (g_i(n+1))_x(L) = 0, \quad \|(g_i(n+1))_x(0)\| \leq \sqrt{\frac{(n+1)c_n}{t_1}},
\]

\[
\int_0^{T_n-2t_1} (S(s)g_i(n+1))_x^2(0) \, ds \leq c_n,
\]
\[ \langle g_{i(n+1)}, g_{j(n+1)} \rangle \leq c_n, \forall (j, i) \neq (n, n+1), j < i, \]
\[ \langle g_{n(n+1)}, g_{(n+1)(n+1)} \rangle \leq 2c_n. \]

Then we derive from (3.17)–(3.18) that

\[ A g_{1(n+1)}, \ldots, A g_{(n-1)(n+1)} \in \text{span}\{ S(\bar{t}_n) y_{1n}, \ldots, S(\bar{t}_n) y_{nn} \}, \]
\[ = \text{span}\{ g_{1(n+1)}, \ldots, g_{n(n+1)} \}, \]

and that

\[ A g_{n(n+1)} = S(\bar{t}_n) A y_{nn} \in \text{span}\{ S(\bar{t}_n) y_{1n}, \ldots, S(\bar{t}_n) y_{(n-1)n}, S(\bar{t}_n) y_{(n+1)n} \}, \]
\[ = \text{span}\{ g_{1(n+1)}, \ldots, g_{(n-1)(n+1)}, g_{(n+1)(n+1)} \}, \]

thus

\[ A g_i(n+1) \in \text{span}\{ g_{1(n+1)}, \ldots, g_{(n+1)(n+1)} \}, \forall i \in \{1, \ldots, n\}. \]

Next, we orthogonalize \{g_{i(n+1)}\} by \{h_{i(n+1)}\}. More precisely, we find an upper triangular matrix \( A_{n+1} = (a_{ij})_{1\leq i,j \leq n+1} \) with \( a_{ii} = 1 \), such that the elements of

\( (h_{1(n+1)}, h_{2(n+1)}, \ldots, h_{(n+1)(n+1)}) \) := \( (g_{1(n+1)}, g_{2(n+1)}, \ldots, g_{(n+1)(n+1)}) A_{n+1}, \)

are orthogonal. In such a case, the orthonormal functions \{y_{i(n+1)}\} can be chosen by

\[ y_{i(n+1)} := L h_{i(n+1)} = \frac{h_{i(n+1)}}{\|h_{i(n+1)}\|} \]

In the remaining part of the proof, we check that \{y_{i(n+1)}\} verify the lemma. Now we need to fix the value of \( a_{ij} \). From the construction of \( h_{i(n+1)} \) we know that

\( \text{span}\{h_{1(n+1)}, \ldots, h_{i(n+1)}\} = \text{span}\{g_{1(n+1)}, \ldots, g_{i(n+1)}\}, \forall i \in \{1, \ldots, n+1\}, \)

which implies that

\[ A h_{i(n+1)}, A g_{i(n+1)} \in \text{span}\{h_{1(n+1)}, \ldots, h_{(n+1)(n+1)}\}, \forall i \in \{1, \ldots, n\}. \] (3.28)

Moreover, by the definition of \( h_{i(n+1)} \),

\[ h_{i(n+1)} \perp g_{j(n+1)}, \forall 1 \leq j < i \leq n+1, \]

hence

\[ 0 = \langle h_{i(n+1)}, g_{j(n+1)} \rangle = \sum_{k=1}^{i} a_{ki} \langle g_{k(n+1)}, g_{j(n+1)} \rangle, \]
which implies

\[ |a_{ji}| \leq c_n \left( \sum_{1 \leq k \leq i-1} |a_{ki}| \right) + |\langle g_{i(n+1)}, g_{j(n+1)} \rangle|, \]

thus

\[ \sum_{1 \leq k \leq i-1} |a_{ki}| \leq \frac{ic_n}{1-(i-1)c_n} \leq \frac{(n+1)c_n}{1-n c_n} \leq 2(n+1)c_n, \forall 1 < i \leq n+1. \]

Therefore,

\[ \| h_{i(n+1)} \| = \| \sum_{k=1}^{i} a_{ki} g_{k(n+1)} \| \in [\sqrt{1-c_n} - 2(n+1)c_n, 1 + 2(n+1)c_n] \subset [1 - 3(n+1)c_n, 1 + 2(n+1)c_n], \]

\[ \| h_{i(n+1)} \|^{-1} \in [1 - 2(n+1)c_n, 1 + 4(n+1)c_n], \forall 1 \leq i \leq n+1. \]

Many informations about the orthonormal basis \( \{y_{i(n+1)}\}_{i \in \{1,\ldots,n+1\}} \) can be obtained from such explicit formulas. At first condition (3.24) is guaranteed by (3.28) and the definition of \( y_{i(n+1)} \). Then,

\[ \|y_{i(n+1)}\|_{H^3} \leq \|h_{i(n+1)}\|^{-1}\|h_{i(n+1)}\|_{H^3}, \]

\[ \leq (1 + 4(n+1)c_n) \sum_{k=1}^{i} a_{ki} \|g_{k(n+1)}\|_{H^3}, \]

\[ \leq \frac{K}{2} (1 + 4(n+1)c_n)(1 + 2(n+1)c_n), \]

\[ \leq \frac{3K}{4}. \]

Similarly, we have

\[ |(y_{i(n+1)})_x(0)| \leq \frac{3}{2} \sqrt{\frac{(n+1)c_n}{t_1}}, \]

\[ \int_0^{T_n-2t_1} \left( S(s)y_{i(n+1)} \right)_x^2(0) ds \leq (1 + 4(n+1)c_n)^2 \int_0^{T_n-2t_1} \left( S(s)h_{i(n+1)} \right)_x^2(0) ds, \]

\[ \leq (1 + 4(n+1)c_n)^2 \int_0^{T_n-2t_1} \left( \sum_{k=1}^{i} a_{ki} \left( S(s)g_{k(n+1)} \right)_x \right)^2(0) ds, \]

\[ \leq (1 + 4(n+1)c_n)^2 \int_0^{T_n-2t_1} \left( \sum_{k=1}^{i} \sqrt{|a_{ki}|} \cdot \sqrt{|a_{ki}|} \left( S(s)g_{k(n+1)} \right)_x(0) \right)^2 ds, \]

\[ \leq (1 + 4(n+1)c_n)^2 \int_0^{T_n-2t_1} (1 + 2(n+1)c_n) \left( \sum_{k=1}^{i} |a_{ki}| \left( S(s)g_{k(n+1)} \right)_x^2(0) \right) ds, \]

\[ \leq (1 + 4(n+1)c_n)^2 (1 + 2(n+1)c_n)^2 c_n, \]

\[ \leq 2c_n. \]
It remains to estimate \( y_{(n+2)(n+1)} := Ay_{(n+1)(n+1)} \). Instead of dealing with \( Ay_{(n+1)(n+1)} \) directly, we consider some \( z_{(n+1)(n+1)} \) such that \( S(\bar{t}_n)z_{(n+1)(n+1)} = y_{(n+1)(n+1)} \), therefore \( Ay_{(n+1)(n+1)} \) can be estimated from observations: (i), (iv) and (v). In fact,

\[
y_{(n+1)(n+1)} = \frac{1}{\|h_{(n+1)(n+1)}\|} \sum_{k=1}^{n+1} a_k(n+1)g_k(n+1),
\]

\[
= \frac{1}{\|h_{(n+1)(n+1)}\|} \sum_{k=1}^{n+1} a_k(n+1)S(\bar{t}_n)y_{kn},
\]

\[
= S(\bar{t}_n) \left( \frac{1}{\|h_{(n+1)(n+1)}\|} \sum_{k=1}^{n+1} a_k(n+1)y_{kn} \right),
\]

while \( z_{(n+1)(n+1)} \) satisfies

\[
\|z_{(n+1)(n+1)}\| \leq (1 + 4(n + 1)c_n)(1 + 2(n + 1)c_n) \leq \sqrt{2},
\]

\[
\int_0^T \left( S(s)z_{(n+1)(n+1)} \right)_x^2(0) ds \leq (1 + 4(n + 1)c_n)^2(1 + 2(n + 1)c_n)^2c_n \leq 2c_n.
\]

Thanks to Observation (i), we have

\[
\|Ay_{(n+1)(n+1)}\| = \|AS(\bar{t}_n)z_{(n+1)(n+1)}\| \leq \sqrt{2}\tilde{K}.
\]

Thus,

\[
y_{(n+2)(n+1)} = \Pi y_{1, \ldots, n(n+1)} Ay_{(n+1)(n+1)},
\]

\[
= Ay_{(n+1)(n+1)} + \sum_{k=1}^{n} b_k y_{k(n+1)},
\]

\[
= AS(\bar{t}_n)z_{(n+1)(n+1)} + \sum_{k=1}^{n} b_k y_{k(n+1)},
\]

with

\[
\| \sum_{k=1}^{n} b_k y_{k(n+1)} \| \leq \|AS(\bar{t}_n)z_{(n+1)(n+1)}\| \leq \sqrt{2}\tilde{K},
\]

which, together with the orthonormal property of \( y_{i(n+1)} \), implies that

\[
\sum_{k=1}^{n} b_k^2 \leq 2\tilde{K}^2.
\]

Finally, we are able to get

\[
|\langle y_{(n+1)(n+1)}, y_{(n+2)(n+1)} \rangle| = |\langle y_{(n+1)(n+1)}, AS(\bar{t}_n)z_{(n+1)(n+1)} + \sum_{k=1}^{n} b_k y_{k(n+1)} \rangle|,
\]
\[
= |(S(\tilde{t}_n)z_{(n+1)(n+1)}, AS(\tilde{t}_n)z_{(n+1)(n+1)})|,
\leq 4\delta \tilde{K}^2 \|z_{(n+1)(n+1)}\|^2 + \frac{c_n}{\delta},
\leq 8\delta \tilde{K}^2 + \frac{c_n}{\delta}, \forall \delta \in (0, 1/2),
\]

and
\[
\int_0^{T_n-\delta t_1} (S(s)y_{(n+2)(n+1)}^\perp)_x(0) \, ds,
= \int_0^{T_n-\delta t_1} \left( \left( S(s)AS(\tilde{t}_n)z_{(n+1)(n+1)} \right)_x(0) + \sum_{k=1}^{n} b_k \left( S(s)y_{k(n+1)} \right)_x(0) \right)^2 \, ds,
\leq (n+1) \int_0^{T_n-\delta t_1} \left( S(s)AS(\tilde{t}_n)z_{(n+1)(n+1)} \right)_x(0) + \sum_{k=1}^{n} b_k^2 \left( S(s)y_{k(n+1)} \right)_x(0) \left( \right)^2 \, ds,
\leq (n+1) \left( 6\tilde{K}^2 \delta^2 + \frac{12c_n}{\delta^2} + 4\tilde{K}^2c_n \right), \forall \delta \in (0, t_1).
\]

Notice that \(\delta_{n+1}^2 < \delta_{n+1}^2\) for any \(\delta_{n+1} < \min\{1/2, t_1\}\), we get the last two inequalities of Lemma 3.2 and complete its proof. \(\square\)

Let us define \(y_{(n+2)(n+1)} := \mathcal{L}y_{(n+2)(n+1)}^\perp\). Then it satisfies
\[
\langle y_{(n+1)}(n+1), y_{(n+2)(n+1)} \rangle = 0, \forall i \in \{1, ..., n\}, \tag{3.29}
\]
\[
|\langle y_{(n+1)(n+1)}(n+1), y_{(n+2)(n+1)}(n+1) \rangle| \leq \left( \frac{\gamma}{2} \right)^2 \frac{c_{n+1}}{\|y_{(n+2)(n+1)}\|^2}, \tag{3.30}
\]
\[
\int_0^{T_n-\delta t_1} (S(s)y_{(n+2)(n+1)}^\perp)_x(0) \, ds \leq \left( \frac{\gamma}{2} \right)^2 \frac{c_{n+1}}{\|y_{(n+2)(n+1)}\|^2}, \tag{3.31}
\]
where \(0 < \delta \leq \min\{1/2, t_1\}\). Suppose that
\[
\frac{3}{2} \sqrt{\frac{(n+1)c_n}{t_1}} < \frac{\gamma}{\sqrt{B(L, K)}}, \tag{3.32}
\]
If \(\|y_{(n+2)(n+1)}\| < \frac{\gamma}{2}\), then the orthonormal basis \(\{y_{i(n+1)}\}_{1 \leq i \leq n+1}\) satisfies conditions (3.7)–(3.11), thus \(\mathcal{B}_\gamma \neq \emptyset\).
If \(\|y_{(n+2)(n+1)}\| \geq \frac{\gamma}{2}\), then from Lemma 3.2 and inequalities (3.29)–(3.31) we derive that the orthonormal functions \(\{y_{i(n+1)}\}_{1 \leq i \leq n+1}\) and normal function \(y_{(n+2)(n+1)}\) satisfy
\[
Ay_{i(n+1)} \in \text{span}\{y_{1(n+1)}, ..., y_{(n+1)(n+1)}\}, \forall i \in \{1, ..., n\},
Ay_{(n+1)(n+1)} \in \text{span}\{y_{1(n+1)}, ..., y_{n(n+1)}, y_{(n+2)(n+1)}\},
\langle y_{i(n+1)}, y_{(n+1)(n+1)} \rangle = 0, \forall i \in \{1, ..., n\},
|\langle y_{(n+1)(n+1)}, y_{(n+2)(n+1)} \rangle| \leq c_{n+1},
\]
\[
\int_0^{T_n-3t_1} \left(S(s)y_{i(n+1)}\right)_x^2(0) \, ds \leq c_{n+1}, \forall i \in \{1, \ldots, n+2\},
\]

this closes the induction loop as the above conditions have the same form of conditions (3.17)–(3.21).

**Step 5**: Find the parameters. Let \( T \geq (3B(L, K) - 1)t_1(K) \). We find

\[
0 < \varepsilon_0 \ll \delta_1 \ll \delta_2 \ll \ldots \ll \delta_{B(L, K)+1} \leq \min\{1/2, t_1\},
\]

such that the increasing sequence \( \{C_n\} \),

\[
C_1 = \left(\frac{\delta_1^2 \tilde{K}^2 + \varepsilon_0}{\delta_1^2}\right) \frac{24}{\gamma^2},
\]

\[
C_2 = \left(\frac{2}{\gamma}\right)^2 \left(24\delta_2^2 \tilde{K}^2 + \frac{192C_1}{\delta_2^2} + 16\tilde{K}^2C_1\right),
\]

\[
C_{n+1} = \left(\frac{2}{\gamma}\right)^2 (n+1) \left(6\tilde{K}^2 \frac{\delta_{n+1}^2}{\delta_{n+1}^2} + \frac{12C_n}{\delta_{n+1}^2} + 4\tilde{K}^2C_n\right), \forall 2 \leq n \leq B(L, K),
\]

satisfies

\[
\frac{3}{2} \sqrt{(n+1)C_n} < \frac{\gamma}{B(L, K)}, \forall 1 \leq n \leq B(L, K),
\]

\[
(n+1)C_n \leq \min\{1/18, 1/2n\}, 1 \leq n \leq B(L, K).
\]

As \( C_n \) is increasing, it suffices to let

\[
C_{B(L, K)} \leq \frac{1}{2B(L, K)} \text{ and } \frac{3}{2} \sqrt{(B(L, K) + 1)C_{B(L, K)}} < \frac{\gamma}{B(L, K)}.
\]

(3.34)

Suppose that the preceding conditions are fulfilled, then clearly we have \( C_n \leq \delta_{n+1}^2 \). For ease of computation, we assume for that moment \( C_n \leq \delta_{n+1}^2 \) and define a sequence \( \mathcal{D}_n \) which is larger than \( C_n \):

\[
\mathcal{D}_0 = \varepsilon_0, \mathcal{D}_1 = \frac{24}{\gamma^2} \left(\frac{\delta_1^2 \tilde{K}^2 + \varepsilon_0}{\delta_1^2}\right), \mathcal{D}_2 = \frac{768}{\gamma^2} \left(\frac{\delta_2^2 \tilde{K}^2}{\delta_2^2} + \frac{\mathcal{D}_1}{\delta_2^2}\right),
\]

\[
\mathcal{D}_{n+1} = \frac{48(n+1)}{\gamma^2} \left(\tilde{K}^2 \frac{\delta_{n+1}^2}{\delta_{n+1}^2} + \frac{\mathcal{D}_n}{\delta_{n+1}^2}\right), \forall n \geq 2.
\]

It suffices to let

\[
\frac{3}{2} \sqrt{(B(L, K) + 1)\mathcal{D}_{B(L, K)}} < \frac{\gamma}{B(L, K)}.
\]

(3.35)
We try to find $\delta_n$ from backward. It is rather easy to fix a constant, as $\tilde{D}_{B(L,K)}$, that verifies (3.35). Then we choose $\delta_{n+1}$ and $\tilde{D}_n$ iteratively by making $\tilde{K}^2\delta_{n+1}^2$ and $\tilde{D}_n/\delta_{n+1}^2$ equivalent,

$$\tilde{K}^2\delta_{n+1}^2 = \frac{\tilde{D}_n}{\delta_{n+1}^2} = \frac{\gamma^2}{96(n+1)}\tilde{D}_{n+1}, \forall n \geq 2,$$

as well as several similar relations for $n = 0$ and 1. Therefore, we conclude that

$$\delta_{n+1} = \left(\frac{\tilde{D}_n}{\tilde{K}^2}\right)^{\frac{1}{2}}, n \geq 0.$$

$$\tilde{D}_{n+1} = \frac{96(n+1)\tilde{K}}{\gamma^2}\left(\tilde{D}_n\right)^{\frac{1}{2}}, n \geq 2; \tilde{D}_2 = \frac{1536\tilde{K}}{\gamma^2}\left(\tilde{D}_1\right)^{\frac{1}{2}}, \tilde{D}_1 = \frac{48\tilde{K}}{\gamma^2}\left(\tilde{D}_0\right)^{\frac{1}{2}},$$

which gives the values of $\tilde{D}_0 = \varepsilon_0 = \varepsilon_0(L, \gamma, K)$:

$$\varepsilon_0 = \left(\tilde{D}_{B(L,K)}\right)^{2B(L,K)}\left(\frac{B(L,K)-1}{\prod_{k=2}^{B(L,K)-1}}\left(\frac{96(k+1)\tilde{K}}{\gamma^2}\right)^{-2^{k+1}}\right)^{-4}\left(\frac{1536\tilde{K}}{\gamma^2}\right)^{-4},$$

as well as the values of $\delta_n$ and $\tilde{D}_n$ that verifies all the above conditions, the details of which we omitted.

To conclude the proof of Proposition 1.3, it suffices to take $K_0 = 2F_s^3$, $K = K_0$, $K_1(L) = K_1(L, K), T_0(K, L) = 3B(L, K) - 1$, and $\varepsilon = \varepsilon(L, \gamma) := \varepsilon_0(L, \gamma, K)$. We say that $\varepsilon_0$ is the value of $\varepsilon$ for Proposition 1.3. Indeed, suppose that procedure does not stop for $1 \leq n \leq B(L, K)$, therefore, we have constructed orthonormal functions $\{y_{B(L,K)+1}\}_{1 \leq i \leq B(L,K)+1} \subset A$, which is in contradiction with Corollary 2.7. It means that the procedure has to stop at a certain step, i.e. there exists $1 \leq m \leq B(L, K)$ such that, we have found orthonormal functions $\{y_{im}\}_{1 \leq i \leq m}$ and function $y_{m+1}^i$ satisfying $\|y_{m+1}^i\| < \frac{\gamma}{2}$, then $\{y_{im}\}_{1 \leq i \leq m}$ verifies conditions (3.7)-(3.11). It means that $\mathcal{B}_\gamma(K_1)$ is not empty.

\[ \square \]

4. LENGTH CRITICAL CASES

Our method also gives the value of observability constant for the case $L \in \mathcal{N}$. The subspace $H$ is called the controllable part, thanks to the observability inequality:

$$\int_0^T |(S(t)u)_x(0)|^2 \, dt \geq c\|u\|_{L^2(0,L)}^2, \forall u \in H.$$

Furthermore, both $H$ and $M$ are $S(t)$ invariant. Therefore, if we replace $L^2$ space by $(H, \| \cdot \|_{L^2})$, then the same results hold, which yields a value of $c(L)$.

Proposition 4.1. Let $K_1 \geq 1, L \in \mathcal{N}$. There exists $\gamma = \gamma(L, K_1) > 0$ effectively computable such that the set $\mathcal{B}_\gamma(K_1)$,

$$\mathcal{B}_\gamma := \{ u \in H^3(0,L;\mathbb{C}) \cap \mathcal{C}H; \| u \|_{L^2} = 1, \| u \|_{H^3} \leq K_1, u(0) = u(L) = u_x(L) = 0, |u_x(0)| < \gamma, \inf_{\lambda \in \mathbb{C}} \| \lambda u - u_x - u_{xxx} \|_{L^2} < \gamma \}$$
Proposition 4.2. There exist $\overline{K}_1(L)$ and $T_0(L)$ such that for any $\gamma > 0$ there is $\varepsilon = \varepsilon(L, \gamma) > 0$ effectively computable with the property that, if there are $u \in H \setminus \{0\}, K_1 \geq \overline{K}_1(L),$ and $T \geq T_0(L)$ satisfying
\[ \int_0^T \left| (S(t)u)_x(t, 0) \right|^2 \, dt < \varepsilon \|u\|^2_{L^2(0, L)}, \]
then $B_\gamma$ is not empty.

Let us comment on Proposition 4.1. Define a set of eigenfunctions $S_L := \{ \lambda; \lambda u = Au, u \in M \}$, then following the proof of Proposition 1.2 we are able to give some computable and small $\gamma$ such that, if $u \in B_\gamma$ then we can find some $u_1$ and some $\lambda \in S_L$ verifying
\[ u_1(0) = u_1(L) = (u_1)_x(L) = (u_1)_x(0) = 0, \| \lambda u_1 - (u_1)_x - (u_1)_{xxx} \|_{L^2} < \gamma_1, \]
where $\gamma_1 = \gamma_1(\gamma)$ can be sufficiently small if $\gamma$ is. This can be considered as perturbation of $M$, thus contradicts the fact that $u \in H$ by assuming $\gamma$ small than a certain computable value.

5. Further comments and questions

This is a quantitative way of characterizing observability constant, mainly based on flux observations and strong smoothing effects of the initial boundary value problem, e.g. Observations (i)–(vii) and Lemma 2.4 in our case. We believe that this method can be applied to many other models. Moreover, it is also of great interests to consider the following further questions.

5.1. Observability constant behavior around critical points

Let $L_0 \in \mathcal{N}$. Our method gives a finite constant $c(L_0) > 0$, while it also provides a vanishing sequence $\{c(L)\}_{L \to L_0}: c(L) \to 0^+$. Apparently, this difference, e.g. the "jump" of the observability, comes from the uncontrollable subspace $M$. Thus when the length is not critical it is natural to ask for the existence of subspace, comparing to $M$, such that the observability constant of the quotient space is continuous. In other words, is that possible to find some finite dimensional space $M_L$ for $L$ near $L_0$ such that the related "observability" of $L^2/M_L$, which is denoted by $c_{H_L}(L)$, satisfies $c_{H_L}(L) \to c(L_0)$.

5.2. Optimal estimates

According to the duality between controllability and observability, the sharp observability inequality constant is also the optimal control cost. This optimal estimate is of both mathematical and engineering interests, as stated in Introduction, it is the fundamental result for many other studies upon this model. However, it does not seem that the value that we obtain in this paper is optimal. Therefore, it would be interesting to further get sharp estimates of $c(L)$.

5.3. Observability inequality for small time

On account of to the smoothing procedure $S(t_1(L, K_1))$ and Lemma 2.6, our constructive approach and quantitative result only apply for large time, i.e. $T$ bigger than some $T_0(L, K_1)$. It is not clear whether some modifications and minimizations on our method can make the time small. What is the behavior of the constant when $T$ tends to 0, and what is the sharp asymptotic estimate? Should the cost be like $Ce^{-\frac{T}{\alpha}}$, as it is the case for many other models [9, 18]?
5.4. Is backstepping another option?

Originally introduced to stabilize system exponentially [15, 20], recently it is further developed as a tool for null control and small-time stabilization problems [14, 17, 28–31], the so called piecewise backstepping, which shares the advantage that the feedback (control) is well formulated. It consists in stabilizing system with arbitrary exponential decay rate (rapid stabilization) with explicit computable estimates, and splitting the time interval into infinite many parts such that on each part backstepping exponential stabilization is applied to make the energy divide at least by 2. Concerning our KdV case, at least for non-critical cases, rapid stabilization by backstepping is achieved in [13], where they used the controllability of KdV equation with control of the form \( b(t) = u_x(t, 0) - u_x(t, L) \) as an intermediate step. If it is possible to perform piecewise backstepping by obtaining \( C e^{\lambda t} \) type estimates on each step, then we are able to get null controllability and small time stabilization with precise cost estimates.

**Appendix A. The \( L \leq 4 \) case**

Let us consider the flow \( y(t) = S(t)y_0 \). Integration by parts and (2.2) show

\[
T \int_0^L y_0^2(x) \, dx \leq \int_0^T \int_0^L y^2(t, x) \, dx \, dt + T \int_0^T y_x^2(t, 0) \, dt,
\]

then Poincare’s inequality leads to

\[
T \int_0^L y_0^2(x) \, dx \leq \frac{T^2}{\pi^2} \int_0^T \int_0^L y_x^2(t, x) \, dx \, dt + T \int_0^T y_x^2(t, 0) \, dt,
\]

which combines with (2.1) yield

\[
\left( T - \frac{L^2(T + L)}{3\pi^2} \right) \int_0^L y_0^2(x) \, dx \leq T \int_0^T y_x^2(t, 0) \, dt.
\]

Consequently, when \( T \) and \( L \) satisfies \( \frac{L^3}{3T\pi^2} + \frac{L^2}{3\pi^2} < 1 \), the observability constant can be \( \frac{3T\pi^2}{3T\pi^2 - L^3 - TL^2} \).

**Appendix B. Sobolev estimates and some properties of the flow**

We start from giving some quantitative Sobolev embedding and interpolation estimates. In the literature these bounds are usually simply provided by some unknown constant \( C \), for example Brezis [4] and Adams [1], though ideas of getting which are well illustrated.

For any \( \xi \in (0, L/3), \eta \in (2L/3, L) \), there exists \( \lambda \in (\xi, \eta) \) such that

\[
|f'(\lambda)| = \left| \frac{f(\eta) - f(\xi)}{\eta - \xi} \right| \leq \frac{3}{L} (|f(\eta)| + |f(\xi)|).
\]

Therefore, \( \forall x \in (0, L) \),

\[
|f'(x)| = \left| f'(\lambda) + \int_\lambda^x f''(t) \, dt \right| \leq \frac{3}{L} (|f(\eta)| + |f(\xi)|) + \int_0^L |f''(t)| \, dt.
\]
then we integrate $\xi$ on $(0, L/3)$ and $\eta$ on $(2L/3, L)$ to get

$$|f'(x)| \leq \frac{9}{L^2} \int_0^L |f(t)| \, dt + \int_0^L |f''(t)| \, dt.$$  

Hence,

$$\int_0^L |f'(x)|^2 \, dx \leq \frac{162}{L^2} \int_0^L |f(t)|^2 \, dt + 2L^2 \int_0^L |f''(t)|^2 \, dt. \quad \text{(B.1)}$$

Because for any $\delta \in (0, L^2]$ there exists $n \in \mathbb{N}$ such that $L/n \in [\delta^{1/2}/2, \delta^{1/2}]$, we can split $[0, L]$ by $n$ parts. By performing (B.1) on each part and combining them together, we get

$$\int_0^L |f'(x)|^2 \, dx \leq 2\delta \int_0^L |f''(t)|^2 \, dt + \frac{648}{\delta} \int_0^L |f(t)|^2 \, dt, \ \forall \delta \in (0, 16],$$

thus

$$\int_0^L |f'(x)|^2 \, dx \leq 42 \left( \delta \int_0^L |f''(t)|^2 \, dt + \frac{1}{\delta} \int_0^L |f(t)|^2 \, dt \right), \ \forall \delta \in (0, 1]. \quad \text{(B.2)}$$

Notice that (B.2) also holds for complex valued functions. By replacing $f$ by $f^{(n)}$, we also get

$$\int_0^L |f^{(n+1)}(x)|^2 \, dx \leq 42 \left( \delta \int_0^L |f^{(n+2)}(t)|^2 \, dt + \frac{1}{\delta} \int_0^L |f^{(n)}(t)|^2 \, dt \right), \ \forall \delta \in (0, 1]. \quad \text{(B.3)}$$

Moreover, we are able to find a constant $E_m^n$ which only depends on $m$ and $n$ such that

$$\int_0^L |f^{(n)}(x)|^2 \, dx \leq E_m^n \left( \delta^{m-n} \int_0^L |f^{(m)}(t)|^2 \, dt + \delta^{-n} \int_0^L |f(t)|^2 \, dt \right), \ \forall \delta \in (0, 1], \quad \text{(B.4)}$$

while, more precisely, $E_m^n$ can be calculated by

$$E_1^n = 42, \quad \text{(B.5)}$$

$$E_{m+1}^m = 2^m 42^m (E_{m}^{m-1})^m, \quad \text{(B.6)}$$

$$E_k^{k-1} = E_k^{k-1}(E_{k}^{k-1} + 1). \quad \text{(B.7)}$$

For ease of notations, we denote

$$a_n := \int_0^L |f^{(n)}(x)|^2 \, dx = \|f\|_{H^n}^2 \text{ and } \|f\|_{H^n}^2 = \|f\|_{H^n}^2 + \|f\|_{L^2}^2.$$

In fact, $E_1^1 = 42$ as shown in (B.2), further estimated are obtained from a reduction procedure on $m$. Suppose that $E_i^n$ with $i \leq m$ are known, then from (B.3) and (B.4) we derive

$$a_{m-1} \leq E_{m-1}^{m-1} \left( \delta_1 a_m + \delta_1^{-m-1} a_0 \right), \ \forall \delta_1 \in (0, 1],$$

$$a_m \leq E_2^1 \left( \delta a_{m+1} + \delta^{-1} a_{m-1} \right), \ \forall \delta \in (0, 1].$$
By taking $\delta_1 := \delta/(2E_2^1E_m^{m-1})$, we obtain
\[ a_m \leq 2E_2^1 \left( \delta a_{m+1} + 2^{m-1}(E_2^1)^{m-1}(E_m^{m-1})^m \delta^{-m} a_0 \right), \]
which concludes (B.6). As for (B.7), we perform (B.3) and (B.4) once again to get, for $k \leq m$,
\[ a_k - a_{k-1} \leq E_k^{-1} (\delta a_k + \delta^{-k} a_0), \]
\[ \leq E_k^{-1} \left( \delta E_{m+1} (\delta^{m+1-k} a_{m+1} + \delta^{-k} a_0) + \delta^{-k} a_0 \right), \]
\[ \leq E_k^{-1} (E_{m+1}^k + 1) \left( \delta^{m+2-k} a_{m+1} + \delta^{-k} a_0 \right). \]

By taking $\delta := (a_0/(a_0 + a_m))^{1/m}$ in (B.3), we get
\[ a_n \leq E_m^n \left( \left( \frac{a_0}{a_0 + a_m} \right)^{\frac{n}{m}} a_m + \left( \frac{a_0 + a_m}{a_0} \right)^{\frac{n}{m}} a_0 \right), \]
\[ \leq 2E_m^n a_0^{\frac{n}{m}} a_m^{\frac{n}{m}}. \]
This implies that
\[ \| f \|_{H^n}^2 \leq 2E_m^n \| f \|_{L^2}^{2(n-1)} \| f \|_{H^m}^{2n}, \]
thus
\[ \| f \|_{H^n}^2 \leq (2E_m^n + 1) \| f \|_{L^2}^{2(n-1)} \| f \|_{H^m}^{2n}, \forall 0 < n < m. \]

Now we turn to the proof of Lemma 2.6 and Corollary 2.7. Actually, assuming Lemma 2.6, for any $g_i$ there exists $f_{n_i}$ such that
\[ \| g_i - f_{n_i} \|_{L^2} < \frac{\sqrt{2}}{2}. \]
Suppose that $P > R$, then there exists $i \neq j$ such that $f_{n_i} = f_{n_j}$, contradiction, as
\[ \sqrt{2} = \| g_i - g_j \|_{L^2} \leq \| g_i - f_{n_i} \|_{L^2} + \| g_{j} - f_{n_j} \|_{L^2} < \sqrt{2}. \]
It remains to prove Lemma 2.6 which is of course a direct consequence of Rellich’s theorem. In fact, as the injection $H^3 \hookrightarrow L^2$ is compact, it suffices to find a finite open cover composed by the union of balls with radius $\sqrt{2}/2$. By this way, $f_i$ can be chosen in $A$. However, one does not know the exact value of covering balls. Instead, we present a constructive proof, which explicitly characterizes the value of $B$.
Notice that if $f \in A$ then $f$ satisfies, $f \in H$ and $f(0) = f(L) = 0$, which means
\[ f = \sum_{n \in \mathbb{N}^*} a_n \sin \left( \frac{n\pi x}{L} \right) \] in $H^1$.,
with its $H^1$ norm given by

$$\|f\|_{H^1}^2 = \sum_{n \in \mathbb{N}^*} a_n^2 \frac{n^2 \pi^2}{2L}, \quad \|f\|_{L^2}^2 = \sum_{n \in \mathbb{N}^*} \frac{a_n}{2} L.$$  

Thanks to (B.4) and the definition of $A$,

$$\|f\|_{H^1}^2 \leq E_3^1 \left( \int_0^L \|f^{(3)}(x)\|^2 + \|f(x)\|^2 \, dx \right) = E_3^1 \|f\|_{H^3}^2,$$

then

$$\sum_{n \in \mathbb{N}^*} a_n^2 \frac{n^2 \pi^2}{2L} \leq E_3^1 K^2,$$

(B.8)

thus

$$a_n \leq \frac{K \sqrt{2LE_3^1}}{n\pi}.$$  

Next, we pick up all the functions of the following form, which are denoted by $\{f_m\}$,

$$f_m = \sum_{n=1}^{N_c-1} a_n^m \sin \left( \frac{n\pi x}{L} \right),$$

$$|a_n^m| \in \left\{ 0, \frac{K \sqrt{2LE_3^1}}{n\pi}, \frac{1}{M_c}, \frac{K \sqrt{2LE_3^1}}{n\pi}, \frac{2}{M_c}, \ldots, \frac{K \sqrt{2LE_3^1}}{n\pi}, \frac{M_c}{M_c} \right\},$$

where $N_c$ and $M_c$ are some integers only depend on $L$ to be chosen later on.

It can be proved that with a good choice of $N_c$ and $M_c$ the above sequence $\{f_m\}$ satisfies Lemma 2.6. Clearly, $f_m \in C^\infty \subset H^3([0, L])$. Let $f \in A$. On the one hand, thanks to the above construction, there exists a function $f_m$ such that

$$|a_n^m - a_n| < \frac{K \sqrt{2LE_3^1}}{n\pi} \cdot \frac{1}{2M_c}, \forall n \in \{1, 2, \ldots, N_c - 1\}.$$  

Hence

$$\sum_{n=1}^{N_c-1} (a_n^m - a_n)^2 \cdot \frac{L}{2} \leq \sum_{n=1}^{N_c-1} \frac{LE_3^1 K^2}{2M_c^2 n^2 \pi^2} \leq \frac{L^2}{4} \cdot \frac{1}{6} \cdot \frac{E_3^1 K^2}{M_c^2}.$$  

On the other hand, we know from (B.8) that

$$\sum_{n \geq N_c} (a_n^m - a_n)^2 \cdot \frac{L}{2} \leq E_3^1 K^2 \frac{L^2}{N_c^2}.$$
Therefore, we can choose \( M_c \) and \( N_c \) as
\[
M_c = M_c(L) = \left\lceil KL\sqrt{\frac{E^3_3}{6}} \right\rceil, \quad N_c = N_c(L) = \left\lceil 2KL\sqrt{E^3_3} \right\rceil,
\]
which yields
\[
\|f_m - f\|_{L^2}^2 = \sum_{n \in \mathbb{N}^*} (a_n - a_m^n)^2 \frac{L}{2} < \frac{1}{2}.
\]
In such a case, the value of \( B(L, K) \) is given by \((2M_c + 1)^{N_c - 1}\).

**Proof of Lemma 2.2.**

(i). Case \( k = 0 \). It is a straightforward consequence of (2.1)–(2.2) that
\[
F_0^0 = 1, \quad F_1^0 = \sqrt{5L/3}.
\]

(ii). Case \( k = 3 \). Suppose that \( f_0 \in L^2 \), then as \( f \) satisfies
\[
\begin{align*}
  f_t(t, x) &= Af(t, x), \quad t \in (0, T), x \in (0, L) \\
  f(t, 0) &= f(t, L) = f_x(t, L) = 0, \quad t \in (0, T) \\
  f(0, x) &= f_0(x), \quad x \in (0, L),
\end{align*}
\]
we know that \( g := f_t = Af \) is the solution of
\[
\begin{align*}
  g_t(t, x) &= Ag(t, x), \quad t \in (0, T), x \in (0, L) \\
  g(t, 0) &= g(t, L) = g_x(t, L) = 0, \quad t \in (0, T) \\
  g(0, x) &= g_0(x) := (Af_0)(x), \quad x \in (0, L).
\end{align*}
\]

Since
\[
\|u_x\|^2_{L^2} \leq E^1_3(\delta^2 \|u_{xxx}\|^2_{L^2} + \delta^{-1}\|u\|^2_{L^2}),
\]
we have
\[
\|u_x\|_{L^2} \leq \sqrt{E^1_3(\delta \|u_{xxx}\|_{L^2} + \delta^{-1/2}\|u\|_{L^2})}.
\]
Therefore, by choosing \( \delta := 1/\sqrt{4E^3_3} \) we get
\[
\|u_x\|_{L^2} \leq \frac{1}{2}\|u_{xxx}\|_{L^2} + (4E^3_3)^{3/4}\|u\|_{L^2},
\]
which implies
\[
\begin{align*}
\|u_{xxx}\|_{L^2} \leq \|Au\|_{L^2} + \|u_x\|_{L^2}, \\
&\leq \|Au\|_{L^2} + \frac{1}{2}\|u_{xxx}\|_{L^2} + (4E^3_3)^{3/4}\|u\|_{L^2}, \\
&\leq 2\|Au\|_{L^2} + 2(4E^3_3)^{3/4}\|u\|_{L^2}.
\end{align*}
\]
\[
\| \mathbf{A} u \|_{L^2} \leq \| u_{xxx} \|_{L^2} + \| u_x \|_{L^2} \leq (1 + \sqrt{E_3^1}) \| u \|_{H^3}.
\]

(B.9)

Thanks to the result in the case \( k = 0 \), we have
\[
\| f_x \|_{L^2(0,T;L^2)} \leq \sqrt{\frac{2L}{3}} \| f_0 \|_{L^2}, \quad \| f(t) \|_{L^2} \leq \| f_0 \|_{L^2},
\]
and, by replacing \( f \) by \( g \),
\[
\int_0^T \int_0^L g_x^2(t,x) \, dx \, dt \leq \frac{2L}{3} \int_0^L g_0^2(x) \, dx,
\]
\[
\int_0^L g^2(t,x) \, dx \leq \int_0^L g_0^2(x) \, dx,
\]
which implies
\[
\| A f(t) \|_{L^2} \leq \| A f_0 \|_{L^2} \leq (1 + \sqrt{E_3^1}) \| f_0 \|_{H^3},
\]
\[
\| A f_x \|_{L^2(0,T;L^2)} = \| (A f)_x \|_{L^2(0,T;L^2)} \leq \sqrt{\frac{2L}{3}} (1 + \sqrt{E_3^1}) \| f_0 \|_{H^3}.
\]

Hence,
\[
\| f_{xxx} \|_{L^2} \leq 2(1 + \sqrt{E_3^1}) \| f_0 \|_{H^3} + 2(4E_3^1)^{3/4} \| f(t) \|_{L^2},
\]
\[
\leq 2(1 + \sqrt{E_3^1}) \| f_0 \|_{H^3} + 2(4E_3^1)^{3/4} \| f_0 \|_{L^2},
\]
\[
\| f_x \|_{L^2} \leq \frac{1}{2} \| f_{xxx} \|_{L^2} + (4E_3^1)^{3/4} \| f(t) \|_{L^2},
\]
\[
\leq (1 + \sqrt{E_3^1}) \| f_0 \|_{H^3} + 2(4E_3^1)^{3/4} \| f_0 \|_{L^2},
\]
\[
\| f_{xxx} \|_{L^2(0,T;L^2)} \leq 2 \| A f_x \|_{L^2(0,T;L^2)} + 2(4E_3^1)^{3/4} \| f_x \|_{L^2(0,T;L^2)},
\]
\[
\leq 2 \sqrt{\frac{2L}{3}} (1 + \sqrt{E_3^1}) \| f_0 \|_{H^3} + 2 \sqrt{\frac{2L}{3}} (4E_3^1)^{3/4} \| f_0 \|_{L^2},
\]

thus
\[
\| S(t)f_0 \|_{C([0,T];H_{(0)}^3(0,L))} \leq \left( 2(1 + \sqrt{E_3^1}) + 2(4E_3^1)^{3/4} + 1 \right) \| f_0 \|_{H_{(0)}^3(0,L)},
\]
\[
\| S(t)f_0 \|_{L^2(0,T;H_{(0)}^4(0,L))} \leq \left( 2 \sqrt{\frac{2L}{3}} (1 + \sqrt{E_3^1}) + 2 \sqrt{\frac{2L}{3}} (4E_3^1)^{3/4} + \sqrt{L} \right) \| f \|_{H_{(0)}^3},
\]

which gives the value of \( F_0^3 \):
\[
F_0^3 = 2(1 + \sqrt{E_3^1}) + 2(4E_3^1)^{3/4} + 1,
\]
(B.10)
\[ F_1^3 = 2\sqrt{\frac{2L}{3}} (1 + \sqrt{E_3^1}) + 2\sqrt{\frac{2L}{3}} (4E_3^1)^{3/4} + \sqrt{L}. \]  

(B.11)

(iii). Case \( k = 6 \). Suppose that \( f_0 \in H^6_{(0)}(0, L) \), then \( g := f_t = Af \) satisfies

\[
    g_t(t, x) = Ag(t, x), \quad t \in (0, T), x \in (0, L) \\
    g(t, 0) = g(t, L) = g_x(t, L) = 0, \quad t \in (0, T) \\
    g(0, x) = g_0(x) := (Af_0)(x), \quad x \in (0, L),
\]

and \( h := g_t = Ag = A^2 f \) satisfies

\[
    h_t(t, x) = Ah(t, x), \quad t \in (0, T), x \in (0, L) \\
    h(t, 0) = h(t, L) = h_x(t, L) = 0, \quad t \in (0, T) \\
    h(0, x) = h_0(x) := (Af_0)(x) = (A^2 f_0)(x), \quad x \in (0, L).
\]

Simple embedding estimate shows

\[
    \|u^{(4)}\|_{L^2} \leq \frac{1}{4} \|u^{(6)}\|_{L^2} + 16(E_6^4)^{3/2}\|u\|_{L^2}, \quad \|u^{(4)}\|_{L^2} \leq \sqrt{E_6^4} \|u\|_{H^6}, \\
    \|u^{(2)}\|_{L^2} \leq \frac{1}{4} \|u^{(6)}\|_{L^2} + 2(E_6^2)^{3/4}\|u\|_{L^2}, \quad \|u^{(2)}\|_{L^2} \leq \sqrt{E_6^2} \|u\|_{H^6}.
\]

It is known from the case \( k = 0 \) that

\[
    \|f^{(6)}(t) + 2f^{(4)}(t) + f^{(2)}(t)\|_{L^2} = \|h(t)\|_{L^2} \leq \|h_0\|_{L^2}, \\
    \|f^{(7)} + 2f^{(5)} + f^{(3)}\|_{L^2(0, T; L^2)} = \|h_x\|_{L^2(0, T; L^2)} \leq \sqrt{\frac{2L}{3}} \|h_0\|_{L^2},
\]

which, combined with the preceding embedding estimates, yields

\[
    \|f^{(6)}(t)\|_{L^2} \leq 4\|h_0\|_{L^2} + 128(E_6^4)^{3/2}\|f\|_{L^2} + 32(E_6^2)^{3/4}\|f\|_{L^2}, \\
    \leq \left( 8\sqrt{E_6^4} + 4\sqrt{E_6^2} + 128(E_6^4)^{3/2} + 8(E_6^2)^{3/4} \right) \|f_0\|_{H^6},
\]

and

\[
    \|f^{(7)}\|_{L^2(0, T; L^2)} \leq 4\|h_x\|_{L^2(0, T; L^2)} + 128(E_6^4)^{3/2}\|f_x\|_{L^2(0, T; L^2)} + 8(E_6^2)^{3/4}\|f_x\|_{L^2(0, T; L^2)}, \\
    \leq 4\sqrt{\frac{2L}{3}} \|h_0\|_{L^2} + \sqrt{\frac{2L}{3}} \left( 128(E_6^4)^{3/2} + 8(E_6^2)^{3/4} \right) \|f_0\|_{L^2}, \\
    \leq \left( 8\sqrt{\frac{2L}{3}} (E_6^4)^{1/2} + 4\sqrt{\frac{2L}{3}} (E_6^2)^{1/2} + 128 \frac{2L}{3} (E_6^4)^{3/2} + 8 \frac{2L}{3} (E_6^2)^{3/4} \right).
\]

Thus, the value of \( F_0^6 \) can be chosen as

\[
    F_0^6 = 8\sqrt{E_6^4} + 4\sqrt{E_6^2} + 128(E_6^4)^{3/2} + 8(E_6^2)^{3/4} + 1,
\]
**(iii). Case** $k = 1, 2, 4, 5$. It can be achieved by the (real) interpolation of Sobolev spaces. To avoiding getting too much involved into this classical theory, we directly use some quantitative results in [8], and following several related notations there.

$$F_1^6 = 8\sqrt{\frac{2L}{3}}(E^2)^{1/2} + 4\sqrt{\frac{2L}{3}}(E_6^2)^{1/2} + 128\sqrt{\frac{2L}{3}}(E^4_6)^{3/2} + 8\sqrt{\frac{2L}{3}}(E^3_6)^{3/4} + \sqrt{L}.$$  

The interpolation spaces as well as their norms are given by $K$-method,

$$\|u\|_{\mathcal{H}^m(\mathbb{R})}^2 := \sum_{\alpha \leq m} \left( \frac{m}{\alpha} \right)^2 \|\partial^{\alpha} u\|^2_{L^2(\mathbb{R})}, \quad \|u\|_{\mathcal{H}^m(0, L)}^2 := \sum_{\alpha \leq m} \left( \frac{m}{\alpha} \right)^2 \|\partial^{\alpha} u\|^2_{L^2(0, L)}.$$  

the interpolation spaces as well as their norms are given by K-method,

$$\overline{H^1} = (\mathcal{H}^0(0, L), \mathcal{H}^3(0, L))^{\frac{1}{3}}, \quad \overline{H^2} = (\mathcal{H}^0(0, L), \mathcal{H}^5(0, L))^{\frac{1}{3}}, \quad \overline{H^3} = (\mathcal{H}^3(0, L), \mathcal{H}^7(0, L))^{\frac{1}{3}}, \quad \overline{H^4} = (\mathcal{H}^6(0, L), \mathcal{H}^9(0, L))^{\frac{1}{3}},$$  

$$\overline{H^5} := (L^2(0, T; \mathcal{H}^1(0, L)), L^2(0, T; \mathcal{H}^4(0, L)))^{\frac{1}{3}}, \quad \overline{H^6} := (L^2(0, T; \mathcal{H}^4(0, L)), L^2(0, T; \mathcal{H}^7(0, L)))^{\frac{1}{3}}, \quad \overline{H^7} := (L^2(0, T; \mathcal{H}^7(0, L)), L^2(0, T; \mathcal{H}^{10}(0, L)))^{\frac{1}{3}}.$$  

Then we have the following lemma concerning these interpolation spaces.

**Lemma B.1.** (I) There exists an extension $\mathcal{E}$ and constants $\lambda_m = \lambda_m(L)$ such that

$$\mathcal{E} : \mathcal{H}^m(0, L) \to \mathcal{H}^m(\mathbb{R}),$$  

$$\|u\|_{\mathcal{H}^m(0, L)} \leq \|\mathcal{E} u\|_{\mathcal{H}^m(\mathbb{R})} \leq \lambda_m \|u\|_{\mathcal{H}^m(0, L)}, \quad \forall m \in \{0, 1, 2, 3, 4, 5, 6, 7\}.$$  

(II) The norms $\mathcal{H}^m(0, L)$ and $\overline{H^m}$ are equivalent:

$$(\lambda^0)^{-\frac{2}{3}} (\lambda^3)^{-\frac{1}{3}} \|u\|_{\mathcal{H}^1(0, L)} \leq \|u\|_{\overline{H^4}} \leq \|u\|_{\mathcal{H}^1(0, L)},$$  

moreover,

$$(\lambda^1)^{-\frac{2}{3}} (\lambda^4)^{-\frac{1}{3}} \|u\|_{L^2(0, T; \mathcal{H}^2(0, L))} \leq \|u\|_{\overline{H^7}} \leq \|u\|_{L^2(0, T; \mathcal{H}^2(0, L))}.$$  

Similar results hold for $\overline{H^m}$ and $\overline{H^m}^{m+1}$ when $m \in \{2, 4, 5\}$.

(III) There exist constants $G^m$ such that

$$\|u\|_{\mathcal{H}^m(0, L)} \leq \|u\|_{\mathcal{H}^m(0, L)} \leq G^m \|u\|_{\mathcal{H}^m(0, L)}, \quad \forall m \in \{0, 1, 2, 3, 4, 5, 6, 7\}.$$  

**Proof of Lemma B.1.**

(I) This is a classical extension problem, we recall Stein ([26], p. 182, Thm. 5') for a precise construction. In fact the same type of results also exists for many other spaces, like Besov space etc.

(II) Inequality (B.12) is exactly ([8], Lem. 4.2), and the same method also leads to (B.13).
The first inequality is obvious. It suffices to prove the second one. If \( m = 0 \) or \( 1 \), then \( G^m = 1 \). Else, we get from the definition that

\[
\|u\|_{H^m(0,L)}^2 = \sum_{\alpha \leq m} \left( \frac{m}{\alpha} \right) \|\partial^\alpha u\|_{L^2(0,L)}^2 = \|u\|_{H^m(0,L)}^2 + \sum_{0 < \alpha < m} \left( \frac{m}{\alpha} \right) \|E_m^\alpha \|_{H^m(0,L)}^2 \leq \|u\|_{H^m(0,L)}^2 + \sum_{0 < \alpha < m} \left( \frac{m}{\alpha} \right) E_m^\alpha \leq 1 + \sum_{0 < \alpha < m} \left( \frac{m}{\alpha} \right) E_m^\alpha \]  

which gives the value of \( G^m \):

\[
G^m := 1 + \sum_{0 < \alpha < m} \left( \frac{m}{\alpha} \right) E_m^\alpha. \]

Armed with the preceding lemma, we can apply the interpolation theory on cases \( k = 1, 2, 4 \) and 5. Here we only prove the case \( k = 1 \), while the other cases can be treated in the same way. Since we are dealing with the KdV flow, we add the natural compatibility conditions on interpolation spaces, for example \( H_1^1(0) \) which is endowed with the same norm as \( H_1^1 \).

For any \( t \in (0,T] \), we define a mapping operator

\[
L_0^t : f \mapsto S(t)f. 
\]

We also define

\[
L_1 : f \mapsto S(t)f, \quad t \in [0,T].
\]

From the preceding part we know that, for \( m \in \{0, 3\} \) the linear operators

\[
L_0^t : H_m^m(0,L) \to H_m^m(0,L), \\
L_1 : H_m^m(0,L) \to L^2(0,T; H_m^{m+1}(0,L)),
\]

are bounded. Indeed, these bounds are given by

\[
\|L_0^t\|_{H^m,H^m} \leq F_0^m G^m, \quad \|L_1\|_{H^m,L^2H^{m+1}} \leq F_1^m G^{m+1}.
\]

Therefore, thanks to the interpolation theory, we get

\[
\|L_0^t\|_{H^m,H^m} \leq \|L_0^t\|_{H^0,H^0} \|L_0^t\|_{H^3,H^3} \leq (F_0^0 G^0)^{\frac{1}{2}} (F_0^3 G^3)^{\frac{1}{2}},
\]

\[
\|L_1\|_{H^m,L^2H^{m+1}} \leq \|L_1\|_{H^0,L^2H^4} \|L_1\|_{H^3,L^2H^4} \leq (F_1^0 G^1)^{\frac{1}{2}} (F_1^3 G^4)^{\frac{1}{2}}.
\]
Thus
\[ \|L^0_0\|_{H^1, H^1} \leq (\lambda^0)^\frac{2}{3} (\lambda^3)^\frac{1}{3} \|L^0_0\|_{H^1, H^1} \leq (\lambda^0 F^0_0 G^0)^\frac{2}{3} (\lambda^3 F^3_0 G^3)^\frac{1}{3}, \]
\[ \|L_1\|_{H^1, L^2 H^2} \leq (\lambda^1)^\frac{2}{3} (\lambda^4)^\frac{1}{3} \|L_1\|_{H^1, L^2 H^2} \leq (\lambda^1 F^1_0 G^1)^\frac{2}{3} (\lambda^4 F^3_0 G^3)^\frac{1}{3}, \]
hence
\[ \|L^0_0\|_{L^1, H^1} \leq G^1 \|L^0_0\|_{H^1, H^1} \leq G^1 (\lambda^0 F^0_0 G^0)^\frac{2}{3} (\lambda^3 F^3_0 G^3)^\frac{1}{3}, \]
\[ \|L_1\|_{H^1, L^2 H^2} \leq G^1 \|L_1\|_{H^1, L^2 H^2} \leq G^1 (\lambda^1 F^1_0 G^1)^\frac{2}{3} (\lambda^4 F^3_0 G^3)^\frac{1}{3}, \]
Hence we get
\[ \|S(t) f_0\|_{L^\infty([0,T]; H^1_{(0)}(0,L))} \leq F^1_0 \|f\|_{H^1_{(0)}(0,L)}, \]
\[ \|S(t) f_0\|_{L^2([0,T]; H^2_{(0)}(0,L))} \leq F^1_1 \|f\|_{H^1_{(0)}(0,L)}, \]
with \( F^1_0, F^1_1 \) defined by
\[ F^1_0 := G^1 (\lambda^0 F^0_0 G^0)^\frac{2}{3} (\lambda^3 F^3_0 G^3)^\frac{1}{3}, \]
\[ F^1_1 := G^1 (\lambda^1 F^1_0 G^1)^\frac{2}{3} (\lambda^4 F^3_0 G^3)^\frac{1}{3}. \]
As the flow conserves the Sobolev regularity, we know that
\[ \|S(t) f_0\|_{C^0([0,T]; H^1_{(0)}(0,L))} \leq F^1_0 \|f\|_{H^1_{(0)}(0,L)}. \]
(B.14)

Similar calculation provides
\[ F^2_0 := G^2 (\lambda^0 F^0_0 G^0)^\frac{2}{3} (\lambda^3 F^3_0 G^3)^\frac{1}{3}, \]
\[ F^2_1 := G^2 (\lambda^1 F^1_0 G^1)^\frac{2}{3} (\lambda^4 F^3_0 G^3)^\frac{1}{3}, \]
\[ F^4_0 := G^4 (\lambda^3 F^3_0 G^3)^\frac{2}{3} (\lambda^6 F^6_0 G^6)^\frac{1}{3}, \]
\[ F^4_1 := G^4 (\lambda^4 F^3_0 G^3)^\frac{2}{3} (\lambda^7 F^6_0 G^6)^\frac{1}{3}, \]
\[ F^5_1 := G^6 (\lambda^3 F^3_0 G^3)^\frac{2}{3} (\lambda^7 F^6_0 G^6)^\frac{1}{3}. \]

\[ \square \]

**Proof of Lemma 2.4.** Since the \( L^2 \) energy of the flow decays, it suffices to prove (2.5). For any \( t \in (0,T] \), there exists a unique \( n \in \mathbb{Z} \) such that \( t \in (2^n, 2^{n+1}] \). Then, thanks to Lemma 2.2, we can find some \( t' \in (2^n, 2^n] \) satisfies
\[ \|S(t') f_0\|_{H^{k+1}_{(0)}} \leq F^k_1 2^{-(n-1)/2} \|f_0\|_{H^{k}_{(0)}}, \]
(B.15)

Otherwise, we have
\[ \int_0^T \|S(t') f_0\|_{H^{k+1}_{(0)}} dt \geq \int_{2^{n-1}}^{2^n} \|S(t') f_0\|_{H^{k+1}_{0}} dt, \]
\[ > \int_{2^{n-1}}^{2^n} (F^k_1) 2^{-(n-1)} \|f_0\|_{H^{k}_{(0)}} dt, \]
which is in contradiction with (2.4). Thanks to inequality (2.3), we get

\[ \|S(t)f_0\|_{H^k_0} \leq 2^{-\left(n-1\right)/2}F_1 F_0^{k+1}\|f_0\|_{H^k_0}, \]

\[ \leq 2t^{-1/2}F_1 F_0^{k+1}\|f_0\|_{H^k_0}, \quad \forall t \in (0, T], \quad T \leq L. \quad (B.16) \]

By applying (B.16) with \( k = 0, 1, \ldots, k \) respectively, we are able to get

\[ \|S(t)f_0\|_{H^k_0} = \left\| \left( S\left( \frac{t}{n} \right) \right)^n f_0 \right\|_{H^k_0}, \]

\[ \leq 2^{\left(\frac{t}{n}\right)^{-1/2}}F_1^{n-1}F_0^n \left\| \left( S\left( \frac{t}{n} \right) \right)^{n-1} f_0 \right\|_{H^{n-1}_0}, \]

\[ \leq 4^{\left(\frac{t}{n}\right)^{-1}}F_1^{n-1}F_0^n F_1^{n-2}F_0^{n-1} \left\| \left( S\left( \frac{t}{n} \right) \right)^{n-2} f_0 \right\|_{H^{n-2}_0}, \]

\[ \leq 2^{n(n-2)/2} \left( \prod_{i=0}^{n-1} F_i F_0^{i+1} \right) \|f_0\|_{L^2}, \quad \forall t \in (0, T], \quad T \leq L. \]

Hence, we conclude the proof of Lemma 2.4 by selecting

\[ F^k_k := 2^{k/2}k^{k/2} \left( \prod_{i=0}^{k-1} F_i F_0^{i+1} \right), \quad k \in \{1, 2, 3, 4, 5, 6\}. \quad (B.17) \]
